Morphological and Physiological Traits

Note: Levy and Feldman {797} studied the inheritance of more than 20 morphological and biochemical traits in crosses of four T. dicoccoides lines and T. durum. Similarly, Kuspira et al. {744} studied 12 qualitative characters in T. monococcum. The symbols applied to the characters examined in these studies are not being reserved and listed in the Catalogue. However, both studies should serve as bases for future work.

In a large study of 6 agronomic traits in a AC Karma/87E03-S2B1 DH population, 24 QTLs were detected in 12 chromosomes {10434}.

1. Gross Morphology: Spike characteristics

Major hexaploid wheat types are categorized into groups with respect to three major gene pairs; viz. Q, C and S1 {1038}.

1. Common wheat Q c S1 v: vulgare group.
2. Club wheat Q C S1 v: compactum group.
3. Shot wheat Q c S1 v: sphaerococcum group.
4. Spelt wheat q C S1 and q C S1 v: spelta group (including vavilovi).

The majority of hexaploid wheat stocks are already, or can be readily, classified into these groups.

Diploid wheat is assumed to be q. Durum and carthlicum groups have the genotype Qv {1049}.

1.1. Squarehead/spelt

Qv{881}. [k{1550}]. 5AL{1293}. bin: 5AL-17{10541}. v: Common wheats. CS; Iranian spelts{0140}. tv: T. turgidum ssp. carthlicum, durum and polonicum{10457}. ma: Complete linkage with cDNA clone PtAq22{0127}; Q was cloned and shown to have similarity to AtAP2 (APETALA 2), the Q allele was more abundantly transcribed than the q allele transcription factors{10457}.

q{881}. [K{1550}]. v: Macha wheats; European spelt wheats{10457}; vavilovi wheats. s: CS*8/White Spring Spelt 5A{1048}. tv: T. turgidum ssp. dicoccum, dicoccoides{10457}. ma: Cent - Xrsq805(Empb)-5A - 4.6 cM - Q - 4.3 cM - Xpsr370-5A{419}; Q was physically mapped in 5AL, fraction length 0.87, bracketed by deletions 5AL -7 and 5AL -23{446}; Q - 9.3 cM - Xpsr370-5A{9903}.

The speltoid phenotype of at least some spelts may be caused by genes at other loci {0140}. Fine mapping of the 20 cM region possessing Q and delimited by deletions 5AL -7 and -23 is reported in {0324}.

1.2. Club/Compact spike

Cv{1517}. [Cd{047}]. 2D{1192}.2DL{1192,1517}.probably 2DL{10578}. bin: C-2DS1 - C-2DL3, markers flanking C were located on either side of the centromere{10578}. i: S-615’11/Elgin{1500}. s: CS*6/Poso 2D{1304}; CS*5/Red Egyptian 2D{1304}. v: Club wheats; Coda{10578}; Corrigin{10578}. ma: Coda / Brundage: Xwmc144-2D - 1 cM - C - 8 cM - Xwmc18-2D; Corrigin / CS (tauschii 2D): Xwmc245-2D - 1 cM - Xcfd16-2D / Xgwm358-2D / C / Xcfd-2D - 1 cM - Xbarc145-2D{10578}. QTL:Six QTLs for spike compactness were detected in Courtot/Chinese Spring but only 4 on chromosome arms 1AL, 2BS, 2DS and 4AS were consistent for at least two years {0114}.

Two additional QTLs for spike compactness were detected in Courtot/Chinese Spring {10080} on chromosome arms 5DL (QCp.icip-5D) and 6DL (QCp.icip-6D). Markers Xcfd26-5D and Xcfd38-6D explained 13.6% and 12.2% of the variance in spike compactness, respectively {10080}.
Although gene C may be present in some forms of group macha \{1447\} and spelta \{0623\}, it is not universally present. Tsunewaki \{1500\} found that compact spike in one form was controlled by polygenes. C may be orthologous to gene Sog for soft glumes on chromosome 2Am \{10578\}.

Tetraploid wheat: A compact spike gene \(C^{17648}\) in mutant line MA 17648 was located in chromosome 5A\{10541\}. \(Xbarc319-5A\) - 9.7 cM - \(C^{17648}\) - 24.8 cM - \(Xgwm179-5A\) \{10541\}. \(C^{17648}\) was distal to the \(Q\) locus \{10541\}.

1.3. Sphaerococcum

The naturally-occurring sphaerococcum gene in chromosome 3D and various mutant alleles conferring a similar phenotype form a homoeologous series. The sphaerococcoid alleles are either recessive or incompletely dominant. All three mapped loci are closely linked to the respective centromeres \{0030\}. The "a" alleles are allocated to Chinese Spring or "normal" wheats.

1.4. Branched spike

Synonyms: branched spike, four-rowed spike, multi-rowed spike, supernumerary spikelet, tetrastichon spikelet.

Branched spike and multi-rowed spike are phenotypes involving the presence of supernumerary spikelets, or the presence of additional spikelets at rachis nodes. A similar condition in rye is known as 'monstrosum ear' (reviewed in \{10637\}). Genetic studies of branched spike in tetraploid and hexaploid wheats indicate that the phenotype is recessive, involves one or more genes, and is strongly influenced by environmental effects. Comparative genetic studies suggest an orthologous gene series in homoeologous group 2 \{10637\}.
3 **Morphological And Physiological Traits**

**bh-D1**{10637}.  [mrs{10637}].  2DS{10637}.  **v:**  Ra1{10637}; Ruc163-1-02 = Ra1 / ZGK242-81{10637}; RUC163167-1-02 = Alana /3/Ra1/ZGK242-82 // Ra1{10637}.  **ma:** Xwmc453-2D / bh-D1 - 7.8 cM - Xwmg988-2D{10637}; Xwmm484-2D - 3.3 cM - Xwmc453-2D/bh-D1 - 3 cM - Xwmg988-2D{10637}.  Ra1 is a mutant stock maintained at the NI Vavilov Research Institute of Plant Industry, St Petersburg, Russia.

A chromosome 2B gene of minor effect was identified {9907}. In a monosomic analysis of the hexaploid line LYB with supernumerary spikelets, Peng et al. {9908} located recessive genes in chromosomes 2A and 4A that promote the development of supernumerary spikelets and a gene in chromosome 2D that prevents their expression.

**bh-R1**{10637}.  [mo{10637}].  2R{10637}.  **al:**  S. cereale D40{10637}.  **ma:**  Xrms056-2R - 15.7 cM - bh-R1 - 10.7 cM - Xcfe209-2R{10637}.

1.5. Elongated glume

Elongated glume is the phenotype associated with the polonicum group of tetraploid wheats. Expression in hexaploid wheat is much reduced compared with tetraploids. Matsumura {911} reported linkage of gene $P$ and a gene for red coleoptiles implicating chromosomes 7A or 7B. A different gene was subsequently located in chromosome 7B {9990}.

**P1.**  [P{911}, Eg{922}, P-$A^{pol}${10254}], P-$A^pet$I{10254}.  7AL{922,1547}. 7A or 7B (based on linkage of 0.2 with a gene for red coleoptile){922}.  **i:**  Saratovskaya298//Novsibirskaya 67'/T. polonicum{922,0066}.  **itv:**  P-LD222 = LD222 11/T. turgidum var polonicum{1546,1547}.  **tv:**  T. polonicum{10254}; T. petropavlovskyi{10254}.  **ma:**  Xgwm260 - 7A(S) - 2.3 cM - P1 - 5.6 cM - Xgwm1083-7A(L){10254}; Xgwm890 -7A - 2.1 cM - P1{10254}; Xgwm260-7AS - 2.3 cM - P1$^{pol}$ - 5.6 cM - Xgwm1083-7AL {10254}; Xgwm890-7AS - 2.1 cM - P1$^{pet}$ {10254}.

Note: The loci determining elongated glumes in *T. turanicum* and *T. durum* conv. *falcatus* are not homoeologous to the $P$ loci in the centromeric region of the group 7 chromosomes{10254}.

**P2{9990}.**  7BL{9990}.  **itv:**  LD222*7/T. ispahanicum{10990}.  **tv:**  T. ispahanicum{10990}.  According to {10990} the loci of *T. polonicum*, *T. petropavlovsky* and *T. ispahanicum* are allelic ('homoeoallelic') whereas other workers had claimed genes in the first two forms were not allelic. Wang et al. {10254} however concluded that loci bearing alleles for elongated glumes in *T. turanicum* and *T. durum* conv. *falcatus* were not part of the above series.

1.6. Ear length

**QElocs-5A.1{10068}.**  5AL{10068}.  **v:**  CS(T. spelta 5A)/CS(Cappelle-Desprez 5A) RI mapping population{9903}.  **ma:**  Associated with Xbcd9-5A{10068}.

1.7. Multi-gynoeclum

Synonym: three pistils (TP).

This trait describes a dominant phenotype consisting of 3 kernels within each wheat floret; that is, the flower consists of 3 separate ovaries, 3 anthers and 2 lodicules.

**Pis1{10636}.**  2DL{10636}.  **bin:**  C-2DL3-0.49{10636}.  **v:**  TP Mutant{10636}.  **ma:**  Xgwm539-2D - 17.6 cM - Pis1 - 19.5 cM Xgwm349-2D{10636}.

2. Accumulation of Abscisic Acid
A QTL was mapped on 5AL between Xpsr575-5A {proximal} and Xpsr426-5A {distal} {1180}.

3. Alkylresocinols Content in Grain

Ar1{0281}. High alkylresocinols content is dominant {0281}. 5AL{0281}. tv: Langdon{0281}.

ar1{0281}. tv: Ardente{0281}; this cultivar has a low content compared to all tested durum and common wheats{0281}.

4. Aluminium Tolerance

Alt1{234}. v: ET3 = Carazinho/4' Egret{234}.

alt1{234}. v: ES3 = Carazinho/4' Egret{234}.

Alt2{848}. [Alt2{1213}]. 4DL{848}. su: T. turgidum cv. Langdon 4D(4B){848}. v: BH1146{1213}; IAC-24{0115}; IAC-60{0115}; 13 induced mutants of Anahauac{0115}. ma: Alt2 was mapped to a 4 cM interval flanked by Xpsr914-4D and Xpsr1051-4D{848}; on a consensus 4B-4D map of T. aestivum; Alt2 - 1.1 cM - Xbcd1230-4D{1213}; Alt2 cosegregated with Xbcd1230-4D and fell within the interval Xgdm125-4D - 4.8 cM - Alt2 - 1.1 cM - Xpsr914-4D{0248}.

Malate transporter Almt-D1 gene (GenBank AB081803) is completely linked to aluminium tolerance in chromosome arm 4DL between SSR markers Xwmc48b and Xwmc331 in a similar region to Alt2 {10285}. Almt1 transgenic expression in barley conferred and Al-activated efflux of malate with properties similar to those of Al-tolerant wheat {10286}.

Allelic variation at the promoter of Almt-D1 is associated with differences in Al tolerance. Molecular and pedigree analysis suggest that Al resistance in modern wheat germplasm is derived from several independent sources {10532}.

QTL: Atlas 66/Century: A QTL in the region Xgdm125-4DL - Xwmc331-4DL accounted for nearly 50% of the phenotypic variation in root growth rate in hydroponic solution {10265}. An Al-activated malate transporter (LMT1) was earlier mapped to the same location {10266}. Atlas 66 (insensitive)/Chisholm (sensitive) RILs: One QTL, located in chromosome 4DL, corresponded to ALMT1 and accounted for 50% of the phenotypic variation {10483}. A second QTL was located on 3BL(R2 = 0.11); nearest marker Xbarc164-3B {10483}. Both QTLs were verified in Atlas/Century {10483}.

FSW (A1 tolerant) / ND35 (A1 sensitive): 3 QTLs for tolerance, Qalt.pser-4DL co-segregating with Xups4, a marker for the promoter of the ALMT1 gene, Qalt.pser-3BL (Xbarc164-3B - Xbarc344-3B) and Qalt.pser-2A (Xgwm515-2A - Xgwm296-2A) {10605}.

In D genome introgression lines of Chinese Spring a major QTL was located in the interval Xgwm125-4D - Xgwm976-4D, R²=0.31 {10598}, probably coinciding with Alt2. A second QTL from CS, Qalt.ipk-3B, R²=0.49, occurred in interval Xgwm1029-3BL - Xgwm1005-3BL in a CS / CS (Synthetic 3B) population {10598}.

5. Anthocyanin Pigmentation

The genetic determinants of anthocyanin pigmentation of various tissues are largely located in homoeologous regions in group 7, viz. 7BS (Rc-B1, Pc-B1, Plb-B1, Pls-B1) and 7DS (Rc-D1, Pc-d1, Plb-D1), and appear to be linked clusters rather than multiple alleles on each chromosome {10700}. Their relationship with genes for purple auricle and purple pericarp are still not clear.

5.1. Purple anthers.

A single, dominant factor was reported {1326}.
5. Morphological and Physiological Traits

Pan1{921}. 7DS{921}. v: Ilyitcheva{921}; Mironovskaya 808{921}; Novosibirskaya 67{921}; Pyrothrix 28{921}; Saratovskaya 210{921}; Strela{921}; Ukrainka{921}. tv: T. polonicum{921}.

Pan2. 7AS(9959). tv: T. turgidum ssp. dicoccoides acc. MG4343{9959}. ma: Pan2 - 9.2 cM - RcI - 12.2 cM - Xutv1267-7A (proximal){9959}.

5.2. Purple/Red auricles. Purple leaf base/sheath

For review see {1641}. Melz and Thiele {983} described a "purple leaf base" phenotype where anthocyanin pigmentation extended to the leaf base as well as auricles. Purple leaf base was expressed only when pigmentation occurred in the coleoptiles.

An5{983}. 5R{983}.
Pc/Pls/Plb{10692}. 7B{10692}. tv: TRI 15744 (IPK GeneBank, Gatersleben){10692}. ma: Xgwm951-7B - 6.7 cM - Pc/Pls/Plb - 8.2 cM - Pp1 - 8.9 cM - Xgwm753-7B{10692}.

5.3. Red/purple coleoptiles.

There is an orthologous gene series on the short arms of homoeologous group 7. The 'a' alleles confer red coleoptiles.

Rc-A1b{180}. [Rc3]. 7D{596}.7DS{1241,1444,0250}. v: Mironovskaya 808{1444}; Tetra Canthatch/Ae. squarrosa var. strangulata RL 5271, RL 5404{1240}; Tetra Canthatch/Ae. squarrosa var. meyeri RL 5289, RL 5406{1240}; Sears' T. dicoccoides/Ae. squarrosa = Sears' Synthetic{596}. ma: Rc-D1 (distal) - 3 cM - Xpsr108-7D{180}; Xgwm44-7D - 6.4 cM - Rc-D1 - 13.7 cM - Xgwm111-7D{0250}.

Tahir & Tsunewaki{1453} reported that T. spelta var. duhamelianum carries genes promoting pigmentation on chromosomes 7A and 7D and genes suppressing pigmentation on 2A, 2B, 2D, 3B and 6A. Sutka{1444} reported a fourth factor in chromosome 6B and suppressors in 2A, 2B, 2D, 4B and 6A.

The Rc gene appears to encode a transcription activator of late biosynthesis genes involved in the light-regulation of anthocyanin synthesis (studies carried out on CS(Hope 7A) substitution line) {10317}.

5.4. Purple/red culm-straw/stem

Purple or red colour is dominant.

Pcl{743}. [Pc{743}]. 7B{743}.7BS{768}. s: CS 6/Hope 7B{743,768}. itv: LD222*11/CS (Hope 7B){1546}. ma: Pe (proximal) - 5.7 cM - Xpsr10890{557} - 7B{110}2.

Pc2{921}. 7DS{921}. v: Ilyitcheva{921}; Mironovskaya 808{921}; Novosibirskaya 67{921}; Pyrothrix 28{921}; Saratovskaya 210{921}; Strela{921}; Ukrainka{921}. 

Pan1{921}. 7DS{921}. v: Ilyitcheva{921}; Mironovskaya 808{921}; Novosibirskaya 67{921}; Pyrothrix 28{921}; Saratovskaya 210{921}; Strela{921}; Ukrainka{921}.
5.5. Purple grain/pericarp

Genes for purple pericarp were transferred from tetraploid wheats to the hexaploid level \{112,214,941,1138\}. At the hexaploid level duplicate genes \{112,941\} and complementary genes \{112,939,1138,438\} were reported. At the tetraploid level, duplicate-gene \{941\} and single-gene \{1327\} inheritances were observed. Purple colour is dominant and may be affected by environment and genetic background. Complementary genes were located in chromosomes 3A and 7B \{1138\}. Possible pleiotropic relationships of genes affecting pigmentation of various tissues have not been studied in detail. \(Pc\) and \(Rc-B1a\) may be the same gene \{769\}. Also, complementary genes involved in determination of purple pericarp could be related to culm colour \{112\}. For review, see \{1643\}.

Complementary dominant genes.

\(Pp1\) \{041\}. \(6A\{041\},7BL\{10392\}. \(i\): Saratovskaya 29*8/Purple \{Australia\} \(Pp2\{040\}. \(v\): Novosibirsk 67 (this cultivar has white pericarp) \{10392\}. \(v2\): Purple K49426 \(Pp3a\{10392\};\) Purple Feed \(Pp3b\{10392\}. \(ma\): \(Xgwm983-7B - 15.2\ cM - Pp1 - 11.3\ cM - Xgwm767-7B\{10392\}.

6. Awnedness

\(hd\ b1\ b2\). Bearded or fully awned genotype

6.1. Dominant inhibitors

6.1.1. Hooded

\(Hd\{1551\}. \(4AS\{1195,1293\}. \(i\): S-615*11/CS\{1500\}. \(v\): Chinese Spring B2\{1293\}. \(ma\): \(Xcdo1387-4A - 8.2\ cM - Hd - 7.2\ cM - Xpsr163-4A\{0047\} was mapped as a QTL with a peak on Xfba78-4A\{0309\}.

\(hd\ s\): CS*6/Hope 4A; CS*5/Thatcher 4A; CS*6/Timstein 4A.
6.1.2. Tipped 1

**B1**{1551}.  5AL{1293,0242}.  \(i\): S-615*11/Jones Fife{1500}.  \(v\): Timstein{741}; Redman{160}; WAWHT2046{10040}.  \(tv\): LD222{10541}.  \(ma\): \(Xgwm410.2-5A\) - 8.2 cM - **B1** - 12.2 cM - **Yr34**{10040}; Terminally located{10189}; \(Xgwm291-5A.3\) - 5.3 cM - **B1**{10330}.  \(matv\): \(Xgwm291-5A\) - 8.0 cM - **B1**{10541}.  

\(B1\) was mapped as a QTL with a peak on \(Xwmc182-6B\) {0309}.  

\(B1a\)\{041\}.  \(s\): Saratovskaya 29′8/Festiguay 5A{041}.  

\(B1b\)\{041\}.  \(s\): Saratovskaya 29′8/Aurora 5A{041}.  

\(B1c\)\{041\}.  \(s\): Saratovskaya 29′8/Mironskaya 808 5A{041}.  

In a common genetic background, carriers of \(B1a\) have the shortest tip-awned phenotype; carriers of \(B1b\) and \(B1c\) have awns 2 to 3 times longer depending on environment. In F1 hybrids, differences between the substitution line combinations are significant. The postulation of \(B1\) in both CS and Courtot {0309} based on the phenotype of a CS deletion stock is not supported by genetic observations.

6.1.3. Tipped 2

**B2**{1551}.  6BL{1293,1297}.  \(i\): S-615*11/CS{1500}.  \(v\): Chinese Spring \(Hd\){1293}.  

\(b2\).  \(s\): CS*6/Hope 6B; CS*5/Thatcher 6B; CS*9/Timstein 6B.

6.1.4. Awnless

Genotypes \(Hd\ B2\) (e.g., Chinese Spring) and \(B1\ B2\) (e.g., Federation) are awnless. Presumably \(Hd\ B1\) is awnless. Watkins & Ellerton {1551} noted the probability of a third allele "\(b1a\)" leading to a half-awned condition, and in discussion they consider the possibility of a similar third allele at the \(B2\) locus. In view of more recent cytogenetic analyses, it seems that the half-awned condition could result from epistatic interactions between the alleles \(B1\) and/or \(B2\) and various promotor genes.

Although hooded, half-awned, tip-awned and awnless variants occur among tetraploid wheats, these are relatively infrequent. It has not been established with certainty that the above inhibitors are involved. The inhibitor alleles have a pleiotropic effect on glume-beak shape {1348}. Acuminate beak is associated with full beardedness and occurs only in \(b1\ b2\) types. \(B2\) reduces beak length producing an acute beak shape. \(B1\) reduces beak length producing an obtuse beak shape. In this effect \(B1\) is epistatic to \(B2\).

6.2. Promotors

The effects of (recessive) awn-promoting genes were documented in a number of studies, mainly through monosomic and disomic F1 comparisons, and in tetraploids, whereas Heyne & Livers {549} provided genetic evidence of their effects. A series of "\(a\)" genes was documented, but the evidence for the existence of at least some of these was not well supported. Hence symbols for this gene series are not recognized.

6.3. Smooth awns

Smooth-awned tetraploid wheats were reported {016,045,690,1259} and genetic analyses {016,045,690} suggested a single recessive factor, with modifiers in most instances, relative
to rough awns. The phenotype has not been reported in hexaploid wheats. No gene symbol is applied.

7. Basal Sterility in Speltoids

The presence of gene $Q$ ensures the fertility of the first and subsequent florets in wheat spikelets \{378\}. In speltoids lacking $Q$, fertility of the second and subsequent florets is ensured by the dominant allele $Bs$ (designated $A$ in \{378\}) located on chromosome 5D \{377\}. In the presence of $Bs$ the fertility of the first floret is under polygenic control. In $bs$ $bs$ speltoids floret development is under polygenic control, and stocks with varying levels of basal fertility were isolated. All group vulgare genotypes so far studied carry $Bs$.

The following stocks were described \{378\}:

<table>
<thead>
<tr>
<th>Genotype</th>
<th>Approx. sterile-base score</th>

</table>

8. Blue Aleurone

The $Ba$ allele in $T. monococcum$ spp. aegilopoides acc. G3116 determines a half-blue seed phenotype and is different from the allele present in Elytrigia pontica that determines a solid blue phenotype \{282\}. They are treated as different genes.

For review see \{1643\}.

A gene(s) in chromosome 6A acts as an inhibitor of corroded \{1039,1570\}.
16. Crossability with Rye and *Hordeum* and *Aegilops* spp.

16.1. Common wheat

High crossability of some wheats, particularly those of Chinese origin, viz. Chinese 446 {790}, Chinese Spring {1216}, and TH 3929 {939}, with cereal rye, weed rye (*S. segetale* L.) {1646}, and other species, e.g., *Aegilops squarrosa* {691}, *Hordeum bulbosum* {1387,1397,1469} and *H. vulgare* {349,693}, is determined by additive recessive genes. The *kr* genes influence crossability with *H. vulgare*. Allele *kr1* is more potent in suppressing crossability than *Kr2* which is stronger in effect than *Kr3* {1387}. According to Zheng et al. {1649}, the effect of *Kr4* falls between *Kr1* and *Kr2*. 

- **Kr1**: 5B{1216}.5BL{762}.
- **kr2**: 5A{1216}.5AL{1387}.
- **kr3**: 5D.
- **kr4**: 1A{1649}.

For *kr1* and *kr2*:

- **v**: Chinese 446{790}; Chinese Spring{762,1216,1025}; Martonvarsari 9*4/CS{1016}.
- **s**: CS*6/Hope 5B{762,1216}.

For *kr1* and *kr2*:

- **v**: Blausamtiger Kolben{790}.

For *kr1* and *kr2*:

- **v**: Marquis{790}; Peragis{790}.

For *kr1* and *kr2*:

- **v**: J-11{1649}.

Using the Chinese Spring/Cheyenne chromosome substitution series, Sasaki & Wada {1265} found significant differences in crossability for chromosome 5B, 7D, 1D and 4B. Differences between rye lines also occur {1265,1458}. Allelic variation in the potency of the dominant suppressor genes was reported {1385,343}. Evidence for allelic variation in dominant suppressors is reported in {1386}. Lists of wheat/rye crossabilities:{1383,1642,850,858}.

QTL: 65% of the variability in a Courtot/CS population was associated with *Xfba-367-5A*(5AS), *Xwg583-5B*(5BL) and *Xtam51-7A*{0134}. Only the second QTL appears to coincide with known locations of *Kr* genes.

16.2. Tetraploid wheat

The Chinese tetraploid, Ailanmai, possesses recessive crossability genes on chromosomes 1A, 6A and 7A with the 6A gene being the least effective {0017}.

17. Dormancy (Seed)

Seed dormancy in wheat has several components, including factors associated with vivipary and red grain colour. Dormancy is an important component of resistance/tolerance to pre-harvest sprouting (PHS).

17.1. Vivipary

Orthologues of maize viviparous 1 (*Vp-1*) are located in chromosomes 3AL, 3BL and 3DL {9961} approximately 30 cM distal to the *R* loci. Variability at one or more of these loci may be related to germination index and hence to PHS {10468}.

A alleles of *Vp-A1* were recognized using STS marker A17-19 {10919}.

Three sequence variants of *Vp-B1* identified in {10468} were used to develop STS marker VpiB3 whose amplified products showed a significant, but not complete, association with germination index used as one measure of PHS.
Alleles of *Vp-B1* were recognised using STS marker Vp1B3 \{10615, 10621\}.

**Vp-A1** \{10919\}. 3AL \{10919\}.
- **Vp-A1a** \{10919\}. *v*: Nongda 311 \{10919\}. *c*: 599 bp \{10919\}. Higher germination index.

- **Vp-A1f** \{10919\}. *v*: Yumai 34 \{10919\}. *c*: 545 bp \{10919\}. Higher germination index.

**Vp-B1**.
- **Vp-B1a** \{10615\}. *v*: Charger \{10616\}; Zhongyou 9507 \{10615\}; 271 accessions \{10616\}. *c*: AJ400713 \{10615\}.
- **Vp-B1b** \{10615\}. *v*: Altria \{10616\}; Recital \{10616\}; Yongchuanbaimai \{10615\}; 2 accessions \{10616\}. *c*: 193 bp insertion in third intron relative to *Vp-A1a*.
- **Vp-B1c** \{10615\}. *v*: Scipion \{10616\}; Xinong 979 \{10615\}; 101 others \{10616\}. *c*: 83 bp deletion relative to *Vp-B1a*.
- **Vp-B1d** \{10615\}. *c*: 25 bp deletion relative to *Vp-A1a*.
- **Vp-B1e** \{10615\}. *v*: Hongsheshanghai \{10616\}. *c*: 83 bp deletion, 4 bp insertion and 2 SNPs relative to *Vp-B1a* \{10621\}.

**Vp-D1** \{10919\}. AJ400714 \{10919\}. 3DL \{10919\}.
- **Vp-D1a** \{10919\}. AJ400714 \{10919\}. 3DL \{10919\}. *v*: 81 Chinese wheat cultivars \{10919\}. *c*: 5 pairs of primers \{10919\}.

There was a suggestion of a relationship between alleles and PHS response \{10615\}. *Vp-B1* allelic identifications for Chinese landraces, historical and current wheat cultivars are listed in \{10621\}.

### 17.2. Pre-harvest sprouting

**Phs1** \{10500\}. Semi-dominant \{9960\}. \[Phs\{9960\}\]. 4AL \{9960\}. *i*: Haruyokoki*6/Leader \{10500\}; Haruyokoki*6/Os21-5 \{10500\}. *v*: Leader \{10500\}; Os21-5 \{10500\}; Soleil \{9960\}. *ma*: Associated with Xpsr327-3A \{10346\}; Xhbe03-4AL - 0.5 cM - Phs1 - 2.1 cM - Xbarc170-4AL \{10500\}.

**phs1**. *v*: Haruyokoki \{10500\}.

QTL: Several QTL for falling number and alpha-amylase activity, two indicators for pre-harvest sprouting resistance, were identified in \{0169\}. The most significant were associated with Xglk-699-2A and Xsfr4(NBS)-2A, Xglk80-3A and Xpsr1054-3A, Xpsr1194-5A and Xpsr918-5A, Xpsr644-5A and Xpsr945-5A, Xpsr8(Cxp3)-6A and Xpsr563-6A, and Xpsr350-7B and Xzh232(Tha)-7B \{0169\}.

In cross AC Domain/Haruyutaka, one major QTL in chromosome 4AL and two lesser possibly homomeologous QTLs for dormancy in 4BL and 4DL \{0226\} were found. Tolerance to preharvest sprouting (PHS) in the cross SPR8198/HD2329 was associated with Xwmc104-6B and Xns101-7D \{0032\}. In AC Domain (red seeded, PHS resistant) / RL4137 (white seeded, PHS moderately resistant) most measures of PHS occurred as clusters at the R loci. However, QSi.crc-5D for sprouting index, R²=0.44, was independent of seed colour \{10626\}.

QTL for preharvest sprouting were identified on chromosomes 3A (associated with
Xfbb293-3A at P=0.01), 3B (associated with Xgwm403-3B and Xbcd131-3B at P=0.001), 3D (associated with Xgwm3-3D at P=0.001) and 5A (associated with Xbcd1871-5A at P=0.001) in the population Renan/Recital {0347}. The resistant alleles on the group 3 chromosomes and on 5A were contributed by Renan and Recital, respectively. All QTL for preharvest sprouting co-located with QTL for grain colour {0347}. Zenkoujikomugi/CS: Qphs.ocs-3A.1 on chromosome 3AS was associated with Xbcd1380-3A and Xfbb370-3A accounting for 38% of the phenotypic variation {10195}. Zenkoujikomugi/Spica: White seeded wheats with the dormancy-related QTL, QPhs-3AS from Zenkoujikomugi were more resistant to PHS than counterparts with the contrasting allele from Spica {10377}. White seeded wheats with contrasting alleles of QPhs-4AS were not different {10377}.

QPhs.ocs-3A.1 was localized to a 4.6 cM interval flanked by Xbarc310-3A and Xbcd907-3A {10245}. A weaker QTL, Qphs.ocs-3A.2 in 3AL, was not associated with TaVp1 {10195}, the wheat orthologue of the maize transcription factor Viviparous-1. Qphs.ocs-4A.1 may be the same as a QTL in AC Domain/Haruyutaka due to tight linkage with Xbcd785-4A {10245}. QPhs.ocs.4B.1, a CS allele contributing to dormancy, was located in the region of Xgwm495-4B {10245}.

In cross SPR 8198 (dormant)/HD2329, QPhs.occusu-3A was located in the Xgwm155-3A - Xwmc153-3A region with R²=75% across 6 environments {10261}. QTL analyses in several crosses {10275} indicated a common region in chromosome 4A associated with dormancy, dormant genotypes included AUS1408, SW95-50213 and Halberd. The location was consistent with Japanese and U.K. work even though different flanking markers were involved.

CN10955 (PHS resistant white seeded) / Annuello (PHS susceptible, white seeded) F8 RIL population: QPhs.dpivic-4A.2 in the Xgwm637-4AS - Xgwm937/Xgwm894-4AL region and QPhs.dpivic-4A.1 in the Xwmc48-4AS - Xgwm397-4AS region {10599}.

Rio Blanco (white seeded, PHS resistant) / NW97S186 (white seeded, PHS susceptible) RIL population: QPhs.pseru-3AS, R²=0.41, Xgwm369-3A - Xbarc12-3A, and one minor QTL {10634}. This major QTL was confirmed in a Blanco / NW98S079 RIL population, R² up to 0.58 {10634}. Qphs.psweru-3A was fine mapped to a 1.4 cM region flanked by two AFLP markers and was tightly linked to Xbarc57-3A and seven other AFLP markers {10893}.

RL4452 (red seeded, low PHS tolerance)/AC Domain (red seeded, high PHS tolerance): DH lines: Genes associated with falling number, germination index and sprouting index contributing to PHS were located on chromosomes 3A, 4A (locus-2) and 4B in AC Domain and 3D, 4A (locus-1) and 7D in RL4452 {10671}.

SPR8198 (red seeded, PHS tolerance)/HD2329 (white seeded, PHS susceptible): RIL population: 7 QTL located on chromosomes 2AL, 2DL, 3AL and 3BL, the most important on 2AL and 3AL {10670}.

Sun325B (dormant white seeded)/QT7475 (semi-dormant white seeded), both parents with the chromosome 4A QTL: DH population: A QTL was located in the Xgwm77-3B - Xwmc527-3B interval (R²=0.19) in the approximate region of the R-B1 locus {10669}.

Diploid wheat

QTL: T. monococcum KT3-5 (non-dormant)/T. boeoticum KT1-1 (dormant): RIL population: QTL on chromosome 5AL, Xcdo1236c-5A - Xabc302-5A, R²=0.2-0.27. Weaker QTLs were found on 3Am(TmAB18 - Xwmc102-3A and Xrz444-3A - TmABF) and 4A(Xrz261-4A - Xrz141-4A) {0892}. The 3A QTL co-located with TmABF and TmAB18 {10417}, derived
from orthologous ABA signaling genes in *Arabidopsis*. The 5A QTL may be orthologous to the barley dormancy gene *SD1* \{10417\}.

Argent (non-dormant, white seeded) / W98616 (dormant, white seeded): 90 DH lines: Strong QTLS on chromosomes 1A, 3A, 4A and 7A and weaker QTLS on 2B, 5B, and 6B, all from W98616 \{10740\}.

18. Ear Emergence

19. Earliness Per Se

Genes for earliness per se \{0023\} affect aspects of developmental rate that are independent of responses to vernalization and photoperiod.

*Eps-1A* \{0364\}. \([Eps-4]\*1\). \(1\)AL \{0364\}. \(dv\): *T. monococcum* DV92 allele for late flowering, G3116 early flowering. \{0364\}. \(ma\): 0.8 cM distal to *Xwgc241-1A* \{0364\}; within a 0.9 cM region within the *VAtpC - Smp* region \{10246\}.

*Eps-5BL.1* \{10075\}. \(5\)BL \{10075\}. \(ma\): QTL mapped on chromosome 5BL, linked to *Xwmc73-5B* (this QTL explained 8% of the variance in flowering time, \(P<0.03\) \{10075\}).

*Eps-5BL.2* \{10075\}. \(5\)BL \{10075\}. \(ma\): QTL mapped on chromosome 5BL, linked to *Xgwm499-5B* (this QTL explained 6% of the variance in flowering time) \{10075\}.

*Eps-1A* \{0024\}. \(3\)A \{0023\}. \(3\)AL \{0024\}. \(v\): Chinese Spring \{0024\}.

*Eps-Wi* \{0025\}. \(v\): Timstein \{0024\}. \(epsCnn*\) \{0025\}. \(su\): Cheyenne\*7/Wichita \(3\)A \{0025\}. \(ma\): Linked to QTLS for plant height, kernel number per spike, and 1,000-kernel weight in RSLs derived from CNN/CNN(W13A) \{0025\}.

QTL: Analysis in Courtot/CS \{0132\}. Two QTLS for narrow-sense earliness were detected on chromosome 2B in a CS/*T. spelta* var. *duhameianum* KT19-1 RI population \{10057\}. These QTLS were associated with markers *Xpsr135-2B* and *Xabc451-2B* \{10057\}. For both QTLS, earliness was conferred by the CS allele.

*QEet.fcw.5AL* identified in *Xfcp359-5A - Xfcp231-5A* interval (\(R^2=0.38\)), at or near the \(Q\) locus in Grandin/BR34 \{10256\}. Grandin was the earlier parent.
20. Embryo Lethality

20.1. Embryo lethality in wheat x rye hybrids

The Chinese Spring (Omperial rye) addition lines 6R and 6RL crossed with different inbred rye lines (R2, R6, R7) produced hybrid seeds with different proportions of differentiated embryos. R2 with (Eml-R1a) gave only undifferentiated embryos; R6 and R7 (with Emr-R1b) gave 74-100% differentiated embryos {10748}. Cross of R2 with the CS nulli-tetrasomics gave differentiated embryos only with N6AT6B and N6AT6D, indicating the presence of a complementary factor Emr-A1 chromosome 6A {10748}.

21. Flowering Time

The isolation of wheat genes orthologous to the Arabidopsis Co and rice Hd1 genes was reported in {10054}. The genomic clones TaHd1-1, TaHd1-2 and TaHd1-3 originate from the long arms of chromosomes 6A, 6B and 6D, respectively. The orthology of the TadHd1 genes with Co/Hd1 was demonstrated by complementation of a rice line deficient in Hd1 function with the TaHd1-1 genomic clone. It should be noted that the wheat TadHd1 and rice Hd1 genes are located in non-syntenic locations {10054}. To date, no variation for flowering time has been identified on the wheat group 6 chromosomes.

Winter wheat cross, Arina (149 days)/Forno (150 days): Six QTL were detected over six environments. The 3 most important, all from Arina, were in chromosomes 6DL (R²=16%), 3DL (R²=14%) and 7BL (R²=13%); 3 others in 2AL, 5BL and 6DL were from Forno {10172}.

Winter wheat cross Ernie (early)/MO94-317 (late), days to anthesis (dta): Qdta.unc-2D, linked to Xbarc95-2D, R² = 0.74 {10456}.

Spring wheat cross: Nanda 2419 / Wangshuibai: Seven QTLs for flowering time identified with earlier alleles for five coming from Nanda 2419: QFlt.nau-1B (closest marker Xbarc80-1B, R²=11 %), QFlt.nau-1D (Xbarc62-1D, Xgwm232-1D, R²=6.13 %), QFlt.nau-2B (Xwmc35-2B, R²=10 %), XFlt.nau-2D (Xwmc601-2D, R²=10 %), XFlt.nau-4A.1 (Xcfd2-4A, Xmag1353-4A, R²=10 %), XFlt.nau-4A.2 (Xmag3386-4A, Xwmc61-4A, R²=18-19 %), XFlt.nau7B (Xmag2110-7B, Xmag1231-7B, Xgwm537-7B, Xwmc218-7B, R²=18 %) {10566}.

QFlt.ipk-3A {0255}. 3AL{0255}. v: Opata/W-7984 (ITMI) RI mapping population{0255}; Lateness was contributed by W-7984{0255}; ma: Associated with Xbcd451-3A{0255}.

QFlt.cri-3B.1 {10567}. Nearest marker Xbarc164-3B; identified in crosses of substitution lines of Ceska Presivka and Zlatka or Sandra {10567}.

Heading date QTL: CI 13227/Suwon 92 RIL population: AFLP marker - 2.6 cM - QHd.pser-2DS - 121.1 cM - Xgwm261-2D {10269}. This QTL could be Ppd-D1 {10269}.

Karl 92*2/TA 4152-4 F2:F4 population: Two QTLs, QHd.ksu-2D, associated with Xgwm261-2D (R²=0.17), and QHd.ksu-3D, associated with Xgwm161-2D 9 (R²) {10273}.

22. Flour Colour

Loci controlling flour colour were identified and mapped in a recombinant inbred population derived from Schomburghk/Yarralinka {9936}. Regions in 3A and 7A accounted for 13% and 60% of the genetic variation, respectively, and Xbcd828-3A, Xcdo347-7A and Xwg232-7A.1 were significantly associated with flour colour. The association was highly significant in all three replicates only for the 7A QTL. Symbols were not assigned to the flour colour loci. See also 29.2. Flour, semolina and pasta colour.
23. Free-threshing Habit

*QFt.mgb-5A* {0046}. 5AL {0046}. tv: Messapia/T. dicoccoides MG4343 mapping population {0046}. ma: Associated with *XksuG44-5A* {0046}.

*QFt.mgb-6A* {0046}. 6A {0046}. tv: Messapia/T. dicoccoides MG4343 mapping population {0046}. ma: Associated with *Xpsr3J2-6A* {0046}.

24. Frost Resistance

*Fr1* {1446}. 5AL {1446}. v: Hobbit {1446}. ma: Mapped to the mid-region of 5AL, 2.1 cM distal from Xcdo504-5A and Xwg644-5A and proximal to Xpsr426-5A {419}; Mapped 2 cM proximal to Xwg644-5A and Vrn-A1 {0291}; and flanked by deletion points 0.67 and 0.68 {0292}.

Studies using *Vrn-1* induced and natural mutants suggest that differences in frost tolerance previously associated to *Fr1* are actually pleiotropic effects of *Vrn-1* {10708}.

*Fr2* {0291}. 5DL {0291}. s: CS7/Cheyenne 5D {0291}. ma: *Fr2* mapped 10 cM proximal to Vrn-D1 {0291}.

*Fr-A2* {10079}. dv: Triticum monococcum. Frost tolerant parent G3116, frost susceptible parent DV92. ma: The QTL mapped on chromosome 5AL had a LOD score of 9 and explained 49% of the variation in frost tolerance. Closest markers: Xbcd508-5A and Xucw90(Cbf3)-5A. These markers are 30 cM proximal to Xwg644-5A, which is closely linked to frost tolerance locus *Fr-1*. Eleven different Cbf transcription factors were identified at the *Fr-A2* locus {10302}; QTLs for frost tolerance in the *Fr-2* region were also identified in wheat chromosome 5B (*Fr-B2* {10079}) and in barley chromosome 5H (*Fr-H2* {10083}).

*Fr-B2*. [Fr-B1 {10075}]. ma: QTL mapped on chromosome 5BL, linked to Xgwm639-5B (this QTL explained 12-31% of the variance in frost tolerance) {10075}. Xgwm639-5B mapped close to Xmwg914-5B, and to Xbcd508-5B, a marker located at the peak of the *Fr-A2* QTL {10075}. This data suggests that this locus is more likely orthologous to *Fr-2* than to *Fr-1*.

*QWin.ipk-6A*. 6AS {0255}. v: Opata/W-7984 (ITMI) RI mapping population {0255}; Winter hardiness was contributed by W-7984 {0255}. ma: Associated with Xfba85-6A and Xpsr10(Gli-2)-6A {0255}.

Responses to cold exposure and their genetics are reviewed in {0020,0274}.

25. Gametocidal Genes

25.1. Gametocidal activity

*Gc1-B1a* {1485}. [Ge1a {1490}, Gc1 {1487}]. 2B {1490}. i: CS8/Aegilops speltoides subsp. aucheri {1487}.

*Gc1-B1b* {1485}. [Ge1b {1490}]. 2B {1490}. i: S8/Ae. speltoides subsp. ligustica {1490}.

*Gc1-C1* {0188}. 2CL {0189}. ad: CS2C {0189}. su: CS2C(2A), CS2C(2B), CS2C(2D) {0189}.

*Gc1-S11a* {1485}. [Ge-S′3 {1485}]. 2S1 {334}. ad: CS/ Ae. sharonensis {334}.

*Gc2-S11a* {1485}. [Ge-S′3 {1485}]. 4S1 {866}. ad: CS/Ae. longissima {866}.
**Morphological And Physiological Traits**

\( \text{Gc2-S1b} \{1485\}. [\text{Gc}-S12\{1485\}]. 4S\{1013\}. \text{ad: } \text{S/Ae. sharonensis}\{1013\}. \text{ma: } \) An EMS-induced \( \text{Gc-2} \) mutant was mapped to a wheat-\text{Aegilops sharonensis} T4B-4S\{8\} \#1 translocation chromosome\{10068\}.

\( \text{Gc3-C1} \{1485\}. [\text{Gc-C1}\{1485\}]. 3C\{333\}. \text{ad: } \text{CS/Ae. triuncialis}\{338\}. \text{Gc1-B1a, Gc1-B1b and Gc1-S1}, classified in the same functional group, are hypostatic to the genes \( \text{Gc2-S11a} \) and \( \text{Gc2-S11b} \). \text{Gc3-C1} \) does not interact with the \( \text{Gc} \) genes in the other two groups.

In addition to these genes, chromosomes carrying gametocidal genes occur in \text{Ae. caudata} \{337\}, \text{Ae. cylindrica} \{336\} and other strains of \text{Ae. longissima} and \text{Ae. sharonensis} \{335,1484\}.

Gametocidal genes in chromosomes in the same homoeologous group have the same gametocidal action \{0190\}. In monosomic additions of chromosomes with gametocidal effects, chromosome deletions and translocations are produced in gametes not having the gametocidal genes. This feature has been exploited to isolate genetic stocks suitable for physical mapping of wheat \{0191\} chromosomes, and of rye \{0192\} and barley \{0193,0194,0195\} chromosomes in a wheat background.

Genes with gametocidal activity (\( \text{Sd1} \{1647\} \) and \( \text{Sd2} \{1161\} \)) in wheat are present in homoeologous group 7 chromosomes of \text{Thinopyrum elongatum} \{653,1647\}. A segment earlier believed to be derived from \text{Thin. distichum} \{889,892\} is probably the same as that from \text{Thin. elongatum} \{1162\}.

In the presence of both \( \text{Sd1} \) and \( \text{Sd2} \), \( \text{Lr19} \) is transmitted preferentially in heterozygotes, the degree of distortion being determined by genetic background. In heterozygotes with the same background, and in the presence of only \( \text{Sd2} \), \( \text{Lr19} \) shows strong self-elimination. Based on these results, it seems likely that the Sears' translocation 7D-7Ag\#7 does not carry \( \text{Sd1} \) \{939\}.

\( \text{Sd1} \{1647\}. 7D\{1647\}. \text{v2: } \text{Agatha} \text{Sd2}\{1647,1161\}. \text{ma: } \text{Proximal to Lr19 and distal to Xpsr165-7D}\{10255\}. \text{igc1}. \text{v: } \text{Chinese Spring}\{1483,1488\}; \text{Forty wheats are listed in}\{1483,1488\}. \text{igc1}. \text{v: } \text{Chinese Spring}\{1483,1488\}; \text{Forty wheats are listed in}\{1483,1488\}.

25.2. Suppression of gametocidal genes

\( \text{Igc1} \{1489\}. \text{Causes suppression of the 3C chromosome gametocidal gene of } \text{Ae. triuncialis}. \)

This alien gametocidal factor also promotes chromosome breakage \{1486\}. \text{3B}\{1488\}. \text{v: } \text{Norin 26}\{1483,1488\}; \text{Nineteen wheats listed in}\{1483,1488\}.

\( \text{igc1}. \text{v: } \text{Chinese Spring}\{1483,1488\}; \text{Forty wheats are listed in}\{1483,1488\}.

26. Gibberellic Acid Response (insensitivity)

\( \text{Gai1}. [\text{GAI1}\{565,1246\}]. 4B\{406\}.4BS\{980\}. \text{i: } \text{See}\{408\}. \text{v: } \text{Norin 10 Der.}\{407,565\}. \text{ma: } \text{Xpsr622-4B (distal) - 1.9 cM - Gai1 - 8.3 cM - Xbed110-4B (proximal)}\{9959\}. \text{tv: } \text{Messapia}\{9959\}.

\( \text{Gai2}. [\text{GAI2}\{565,1246\}]. 4D\{411\}.4DS\{980\}. \text{i: } \text{See}\{408\}. \text{v: } \text{Maris Hobbit}\{411\}; \text{Norin 10 Der.}\{565\}; \text{List in}\{407\}.

\( \text{Gai3}. [\text{GAI3}\{565,1246\}]. 4B\{413\}.4BS\{980\}. \text{i: } \text{See}\{408\}. \text{v: } \text{Minister Dwarf}\{413\}; \text{Selection D6899}\{359\}; \text{Tom Thumb}\{405\}; \text{Tom Thumb Der.}\{565,567\}.

\text{In wheats with Gai3, the aleurone layer fails to respond to applied GA}\{405\}.

Two studies involving crosses between Tom Thumb derivatives and tall parents suggested that gibberellic acid insensitivity and reduced height were controlled by one gene, i.e., \( \text{Gai3} \) \{359,413\}. In a third study involving a Tom Thumb derivative, recombinants were isolated,
indicating separate but linked genes, i.e., Gai3 and Rht-B1c {565,567}. Further evidence was obtained for linkage between genes for gibberellic acid insensitivity and Norin 10 genes for reduced height in hexaploid {568} and durum {720} wheats. Hu & Konzak {567} reported 27% recombination between Gai1 and Rht-B1b and 10% recombination between Gai2 and Rht-D1b in hexaploid wheats involving Norin 10 and Suwon 92 derivatives. In durum derived from crosses involving Norin 10, 15% recombination was obtained between one of the genes for reduced height and gibberellic acid insensitivity {1246,1247}. Gale & Law {403} considered Gai1 and Rht-B1b, Gai2 and Rht-D1b, Gai3/ and Rht-B1c to be pleiotropic genes.

27. Glaucousness (Waxiness/Glossiness)
Glaucousness refers to the whitish, wax-like deposits that occur on the stem and leaf-sheath surfaces of many graminaceous species. The expression of glaucousness depends on the arrangement of wax deposits rather than the amount of wax {603}. Non-glaucous variants also occur and genetic studies indicate that non-glaucousness can be either recessive or dominant. Recessive forms of non-glaucousness are apparently mutants of the genes that produce the wax-like deposits. Dominant non-glaucous phenotypes (as assessed visually) appear to be due to mutations that affect the molecular structure, and reflectance, of the wax-like substances {10001}. The genes involved in wax production and the "inhibitors" are duplicated in chromosomes 2B and 2D. There appear to be independant genes for wax production and "inhibitors" {912,1493,10001}. In earlier issues of the gene catalogue the two kinds of genes were treated as multiple alleles {1432}. All forms of wild and cultivated einkorn are non-glaucous {10001}. Orthologous loci occur in barley chromosome 2HS (gs1, gs6, gs8) {467}, rye chromosome 7RL (wa1) {725} and maize (gl2) {211}. A gene for spike glaucousness, Ws, was mapped distally on chromosome 1BS in the cross T. durum cv. Langdon / T. dicoccoides acc. Hermon H52 {0171}.

27.1. Genes for glaucousness

28. Glume Colour and Awn Colour

Black glumes are now included in the following homoeologous series with red/brown/bronze glumes.

28.1. Red (brown/bronze/black) glumes

The majority of studies report a single dominant gene for red glume colour. A few papers report two factors \{1009,1477,1520\}. Red glume colour in Swedish land cultivars is apparently associated with hairy glumes \{1277\} suggesting, because \( H_g \) is located in chromosome 1A, that a red glume factor different from \( R_g1 \) is involved in the Swedish stocks. Nothing was known of the possible association of such a gene with \( B_g \), another glume colour gene on chromosome 1A. See \{1640\} for review. A chromosome 1A gene, \( R_g3 \), was eventually identified by linkage with \( G_l_i-A_1 \{1405\} \) and shown to cosegregate with \( H_g \{624\} \).

\( R_g-A_1 \{10378\}. \ [R_g3\{562,923,924,9906\}]. \ 1\text{AS}\{562,923,924,9906\} \).

MORPHOLOGICAL AND PHYSIOLOGICAL TRAITS
Morphological and Physiological Traits

28.2. Pseudo-black chaff

This is a blackening condition transferred from Yaroslav emmer to Hope wheat by McFadden at the same time as stem-rust resistance was transferred. The association of this condition with mature-plant stem-rust reaction (Sr2) has been noted in a number of papers. According to {742}, the condition is recessive. Pan {1102} considered linkage with stem-rust reaction could be broken, but this seems unlikely.

\[ Pbc \]

\[ 3B{742}.3BS. s: CS^6/Hope 3B{742}; CS^6/Ciano 5B{939}. \]

28.3. Black-striped glumes

This phenotype was reported in group \textit{dicoeccon}. \( v: \) E4225 {1417}.

28.4. Inhibitor of glume pigment

An inhibitor of glume pigment was reported on chromosome 3A {106}.

28.5. Chocolate chaff

\( cc\)\{719\}. 7B\{719\}.7BS\{665\}. \( tv: \) Langdon mutant\{719\}; PI 349056\{665\}. \( dv: \) CBC-CDD1\{665\}.

The chocolate chaff phenotype was suppressed by a gene(s) in chromosome 7D \{719\}.

28.6. Awn colour

The literature on awn colour is not clear. In general, awn colour is associated with glume colour \{045\}. Occasionally, however, awn colour and glume colour may be different. According to Panin & Netsvetaev \{1103\}, black awns were determined by three complementary genes designated \( Bla1, Bla2, Bla3. \) \( Bla1 \) was located in chromosome 1A and linked with \( Glid 1A (= Gli-A1) \) and \( Hg. \)

\[ QRaw.ipk-1A \{0255\}. 1AS\{0255\}. \( v: \) Opata/W-7984 (ITMI) RI mapping population\{0255\}; The awn colour was contributed by W-7984\{0255\}. \( ma: \) Associated with \( Gli-A1 \{0255\}. \]

\[ QRaw.ipk-1D \{0255\}. 1DS\{0255\}. \( v: \) Opata/W-7984 (ITMI) RI mapping population\{0255\}; Awn colour was contributed by W-7984\{0255\}. \( ma: \) Associated with \( Gli-D1 \{0255\}. \]

\( Bla1 \{10666\}. 1AS\{10666\}. \textbf{bin}: 1AS1-0.47\{10666\}. \( v: \) Svenno\{10666\}. \( ma: \) TC95235 - 4.8 cM - \( Bla1 \{10666\}. \]

29. Grain Hardness/Endosperm Texture

Grain hardness or endosperm texture significantly influences flour milling, flour properties and end-use. The difference in particle size index between a hard wheat (Falcon) and a soft wheat (Heron) was reported by Symes \{1452\} to be due to a single major gene. Symes \{1452\} also found evidence for "different major genes or alleles" which explained differences amongst the hard wheats Falcon, Gabo and Spica. Using Cheyenne (CNN) substitution lines in CS and a Brabender laboratory mill, Mattern et al. \{915\} showed that the hard wheat milling and flour properties of Cheyenne were associated with 5D. Using Hope
5D substitution line in CS [CS(Hope 5D)] crossed to CS, and CS(Hope 5D) crossed to CS ditelosomic 5DL, Law et al. \{777\} showed that grain hardness was controlled by alleles at a single locus on 5DS. The dominant allele, \textit{Ha}, controlling softness was present in Chinese Spring and the allele for hardness, \textit{ha}, was present in the others. A similar study using CS (CNN5D)/CS recombinant inbred lines was reported by Morris et al. \{03106\}.

A pleiotropic result of hardness is the decreased level of a 15 kD starch granule protein, friabilin, on the surface of water-isolated starch \{470\}. In endosperm, soft and hard wheats have similar amounts of friabilin, consequently the distinction between the two textural types depends upon the manner in which the friabilin co-purifies with starch. Friabilin is also referred to by the name 'Grain Softness Protein' (GSP) \{0384\}, and was later shown to be comprised primarily of puroindoline a and puroindoline b \{0295\}. Grain hardness of reciprocal soft x hard F1 kernels was well correlated with friabilin occurrence on starch in triploid endosperm \{0381\}. See IV, Proteins: 5.8 Puroindoline. GSP-1 genes, which are closely related to puroindolines, are also listed in section 5.8.

\textit{Ha} \{777\}. Soft phenotype. 5DS \{777\}. \textit{i}: Falcon/7*Heron, Heron/7*Falcon \{03109\}; Paha*2//Early Blackhull/5*Paha \{0203,0298\}; Early Blackhull Derivative/5*Nugaines \{0203,0298\}. \textit{v}: Chinese Spring \{777,03106\}; Cappelle Desprez \{470\}; Heron \{1452,470\}; Paha, Nugaines \{0203,0298\}; NY6432-18 \{0241\}.

\textit{ha} \{777\}. Hard phenotype \textit{i}: Falcon/7*Heron, Heron/7*Falcon \{03109\}; Paha*2//Early Blackhull/5*Paha \{0203,0298\}; Early Blackhull Derivative/5*Nugaines \{0203,0298\}. \textit{s}: CS*6/Cheyenne 5D \{915\}; CS*6/Hope 5D \{777\}; Capelle Desprez/7/Besostaya 5D \{470\}. \textit{v}: Falcon \{1452,470\}; Holdfast \{470\}; Early Blackhull, Early Blackhull Derivative \{0203,0298\}; Cheyenne \{03106\}; Clark's Cream \{0241\}. \textit{ma}: \textit{Ha} was closely linked to \textit{Xmta9(Pui1)-5D} \{1414\}.

Single factor effects on hardness were found for chromosomes 2A, 2D, 5B and 6D, and interactive effects were found for chromosomes 5A, 6D and 7A \{1414\}. The addition of King II rye chromosome 5R converted Holdfast wheat from hard to soft \{470\}. A 14.5 kD rye analogue was also isolated from 6x triticales which have soft texture \{470\}. All ryes are thought to have soft texture.

Two genes for grain hardness were reported in \{055\}.

Hard and soft NILs are listed in \{0298\}.

\textbf{QTL:} In a DH population of Courtot/CS a major locus in chromosome 5DS coincided with \textit{Ha}; minor QTLs mapped in chromosomes 1A (associated with \textit{Xfba92-1A}) and 6D (associated with \textit{Xgwm55-6D}) \{0141\}.

Ten QTLs for kernel hardness (54 % of the variation) were mapped in 'Forno'/ 'Oberkulmer' spelt \{0280\}. Two QTLs were detected for grain hardness in RILs of the ITMI population (Synthetic / Opata 85) \{10051\}. The QTL on the short arm of chromosome 5D was associated with \textit{Xmta10-5D}, and increased hardness was contributed by Opata \{10051\}. The locus located proximally on the long arm of 5D was associated with \textit{Xbcd450-5D} and increased hardness was contributed by the Synthetic allele \{10051\}.

Two QTLs, \textit{QHa.ksu-3B}, associated with \textit{Xksam9-3B} (R^2=0.09, and \textit{QHa.ksu-5D(Ha)}, associated with \textit{Xcfd-5D} (R^2=0.3), were identified in Karl*2/TA 4152-4 \{10273\}.

Two QTLs were detected for grain hardness in RILs of the ITMI population (Synthetic / Opata 85) \{10051\}. The QTL on the short arm of chromosome 5D was associated with \textit{Xmta10-5D}, and increased hardness was contributed by Opata \{10051\}. The locus located proximally on the long arm of 5D was associated with \textit{Xbcd450-5D} and increased hardness was contributed by the Synthetic allele \{10051\}.

Two QTLs, \textit{QHa.ksu-3B}, associated with \textit{Xksam9-3B} (R^2=0.09, and \textit{QHa.ksu-5D(Ha)}, associated with \textit{Xcfd-5D} (R^2=0.3), were identified in Karl*2/TA 4152-4 \{10273\}.
Using proteomic analysis of 2D-protein gels applied to 101 lines of the Opata/W-7984 (ITMI) RI mapping population, and after a preliminary study of a sub-group of these lines \{10086\}, 446 amphiphilic protein spots were resolved, 170 specific to either of the two parents and 276 common to both \{10087\}. An important category of these proteins comprises the puroindolines. Seventy-two loci encoding amphiphilic proteins were conclusively assigned to 15 chromosomes. At least one Protein Quantity Locus (PQL) was associated with each of 96 spots out of the 170 spots segregating; these PQL were distributed throughout the genome. The majority of the amphiphilic proteins were shown to be associated with plant membranes and/or play a role in plant defence against external invasions. Not only the puroindolines were associated with kernel hardness - a number of other amphiphilic proteins were also found to influence this trait.

Neixiang 188 (hard)/Yanshan 1 (medium hard) RIL population: \textit{QGh.caas-1B.1} with hardness allele from Yanshan 1, \(R^2=0.28\), \textit{Xwms153 - 1BL - Xbarc81 - 1BL} \{10640\}

\section*{30. Grain Quality Parameters}

In the comprehensive study of 46 quality-related traits in a RL4452/AC Domain RIL population, 99 QTLs involving 41 traits were located in 18 chromosomes \{10361\}; 14 QTLs clustered in the \textit{Glu-1B} region (50cM), 20 QTLs occurred in the \textit{Xwmc617-4D - Xwmc48-4D} region (30cM), 10 QTLs mapped to the \textit{Xgwm130-7D - Xwmc405-7D} region (14cM) and 66 QTLs were dispersed \{10361\}. In a large study of 11 seed quality traits in a AC Karma/87E03-S2B1 DH population, 26 QTLs were detected in 7 chromosomes \{10434\}; 6 were clustered in the \textit{Glu-D1} region and 5 were clustered in the \textit{Rht-D1} region.

QTL analyses of 10 milling and baking quality traits (grain hardness, flour yield, grain and flour protein, alkaline water retention capacity (AWRC), sedimentation properties, cookie properties, lactic acid retention, dough strength, extensibility and mixograph properties) in the ITMI population grown in Mexico, France and USA (California) are reported in \{10436\}. Neixing 188 / Yanshan 1 RIL population: 75 QTLs for 5 quality-related traits are reported in \{10640\}.

\subsection*{30.1. Sedimentation value}

\textbf{Qsev.mgb-6A} \{9920\}. \textit{6AL \{9920\}. tv: Nessapia/\textit{T. dicoccoides} MG4343 mapping population\{9920\}. \textit{ma:} Associated with \textit{Xrsq805-6A} \{9920\}.

\textbf{Qsev.mgb-7A} \{9920\}. \textit{7BS \{9920\}. tv: Messapia/\textit{T. dicoccoides} MG4343 mapping population\{9920\}. \textit{ma:} Associated with \textit{Xpsr103-7A} \{9920\}. \textit{QTL:} QTLs Associated with \textit{Glu-1} on chromosome arms 1AL and 1DL and \textit{Gli-1/Glu-3} on 1BS in RSLs from the cross Cheyenne (high quality)/CS (low quality) \{0251\}. Cultivar Cheyenne contributed the higher SDS sedimentation values \{0251\}. The QTL on 1AL coincided with a QTL for bread loaf volume \{0251\}. The QTL on 1DL and 1BS coincided with QTL for bread mixing time \{0251\}.

\subsection*{30.2. Flour, semolina and pasta colour}

\textbf{QTL:} A QTL was detected on chromosome 7A \{9936\}. Cultivar Schomburgk contributed the yellow colour allele in a cross Schomburgk/Yarralinka \{9936\}. Markers \textit{Xcdo347-7A} and \textit{Xwg232-7A} accounted for 60\% of the genetic variation \{9936\}. A Sequence Tagged Site PCR marker is available \{0180\}.

A major QTL was detected in the distal region of chromosome 7BL in the cross Omrabi 5/ \textit{T. dicoccoides} 600545. The QTL explained 53\% of the variation and was completely linked to microsatellite marker \textit{Xgwm344-7B}. Omrabi 5 contributed the allele for high yellow pigment level. Two additional small QTLs were detected on 7AL \{0365\}. Other references to flour
colour are given under Flour Colour, \textit{Lr19}, and \textit{Sr25}.

W9262-260D3 (low yellow colour)/Kofa (high colour): Four QTLs identified on chromosomes 2A (\textit{Xgwm425-2A}), 4B (\textit{Xgwm495-4B}), 6B (\textit{Xgwm193-6B}) and \textit{Psy-B1} (chromosome 7BL) \{10230\}. See also Enzymes Phytoene synthase.

Analysis of yellow flour pigment in a RIL population of PH82-2 (low)/Neixiang (high) revealed major QTL on chromosomes 7A co-segregating with marker \textit{YP7A} (\(R^2 = 0.2\) - 0.28) (see Phytoene synthase 1), and 1B (\(R^2 = 0.31\) - 0.54) probably contributed by 1RS \{10501\}. Huapei 3 /Yumai 57: DH lines: 18 additive QTLs and 24 pairs of epistatic QTLs affected flour colour parameters; \textit{qa-1B}, closely linked with \textit{Xbare372-1B} was associated with variation of \textit{a*}, \(R^2=0.256\) \{10625\}.

A further study confirmed major QTL on chromosome 1RS (\(R^2=0.319\)) and 7A (\(R^2=0.339\)), minor QTL occurred on 1A and 4A \{10716\}.

30.3. Amylose content

Amylose content has a significant effect on industrial quality; for example, reduced amylose wheats perform better in some types of noodles. The waxy protein genes have an important influence, but other genes are also involved.

\textit{QAmc.ocs-4A.I} \{0047\}. \textit{4AS} \{0047\}. \textit{v: CS/CS(Kanto107 4A) mapping population} \{0047\}.

\textit{ma:} Associated with \textit{Xbcd115-4A} and \textit{Xcdo1387-4A} \{0047\}.

30.4. Milling yield

\textbf{QTL:} A QTL was detected on chromosome 3A \{0181\}. Cultivar Schomburgk contributed an allele for the higher milling yield in cross Schomburgk/Yarralinka \{0181\}. RFLP markers \textit{Xbcd115-3A} and \textit{Xpsr754-3A} were associated with this QTL at LOD>3 \{0181\}. A QTL associated with \textit{Pinb} on chromosome arm 5DS was detected in RILs from the cross NY6432-18/Clark's Cream \{0241\}. Cultivar Clark's Cream contributed the higher flour yield allele \{0241\}. This QTL coincided with QTL for hardness, hydration traits (dough water absorption, damaged starch and alkaline water retention capacity (AWRC)), and baked product traits (cookie diameter and cookie top grain) \{0241\}.

30.5. Alveograph dough strength \textit{W}

\textbf{QTL:} QTLs for \textit{W} were detected on chromosome arms 5DS (associated with \textit{Xmta10-5D}), 1AS (associated with \textit{Xfba92-1A}), and 3B (associated with \textit{XksuE3-3B}) in cross Courtot/Chinese Spring \{0141\}. The first two QTLs coincided with those for hardness. Ten QTL for \textit{W} (39\% of the variation), nine QTL for \textit{P} (48\% of the variation) and seven QTL for \textit{P:L} (38\% of the variation) were mapped in Forno/Oberkulmer spelt \{0280\}.

30.6. Mixograph peak time

\textbf{QTL:} A QTL associated with \textit{Glu-Dy1} on chromosome arm 1DL was detected in RILs from the cross NY6432-18/Clark's Cream \{0241\}. Clark's Cream contributed the higher mixograph peak time allele \{0241\}. This QTL coincided with a QTL for bread mixing time \{0241\}.

30.7. Starch characteristics
The Isoamylase-1 gene from *Ae. tauschii* (*Iso-1*) complements the deficient rice sugary-1 mutant line \{10295\}.

**QTL:** QTLs for starch viscosity and swelling were associated with the *Wx-B1* locus in Cranbrook (*Wx-B1a*)/Halberd (null *Wx-B1b*). An additional QTL for starch viscosity was found on 7BL between markers *Xgwm344-7B* and *Xwg420-7B* in the first cross. This QTL disappeared when amylase activity was inhibited indicating that it was determined by the late maturing a-amylase activity contributed by Cranbrook. A QTL for starch viscosity was associated with the *Wx-A1* locus in the cross CD87/Katepwa \{0362\}.

### 30.8. Loaf volume

**Lvl1**\{10312\}.  [*Lvl 1*\{10312\}]  3A\{10312\}.  v: Cappelle Desprez*7/Bezostaya 1 3A\{10312\}.  ma: *Xgwm720-3A-Lvl1* appeared to be located in the *Xgwm2-3A - Xgwm720-3A* region\{10312\}.

**QTL:** Loaf volume score consistent across three environments was scored in a RIL population Renan/Recital and revealed major QTL on chromosomes 3A (flanking markers *Xfbb250-3A*, *Xgwm666-3A*, positive effect from Renan) and 7A (flanking markers *Xcfa2049-7A*, *Xbcd1930-7A*, positive effect from Recital) \{10536\}. A total of 30 QTLs were located on 12 chromosomes, each of which explained between 5.85 and 44.69% of the phenotypic variation; the QTLs of largest effect were located on chromosomes 6B and 6D \{10659\}.

### 30.9. Dough rheological properties

**QTL:** In a Cranbrook/Halberd DH population, environmental factors were a major determinant of dough extensibility whereas additive effects of alleles at the high and low molecular weight glutenin loci determined dough strength \{10247\}.

### 30.10. Grain fructan content

Fructans are non-digestible carbohydrates considered to have health benefits to consumers. **QTL:** Berkut (high fructan concentration) / Krickauff (low fructan concentration): QTL detected on chromosomes 2B, 3B, 5A, 6D, and 7A of which *QGfc.aww-6D.2* (\(R^2=0.17\), nearest marker, *Xbarc54-6D*) and *QGfc.aww-7A.1* (\(R^2=0.27\), *Xgwm681-7A*) had the largest effects \{10631\}.

### 30.11. Water absorption

Neixiang 188 / Yanshan 1 RIL population: *XAbs.caas-5D.1* with positive effects from Yanshan 1, \(R^2=0.3\), *Xcfd18-5DS - Xcfd189-5DS* \{10640\}

### 30.12. Chinese dry noodle quality

Chuan 35050 / Shannong 483 RIL populations: 3 QTLs for noodle palate, elasticity and smoothness clustered near *Glu-D1* with beneficial effects associated with subunits 5+10 coming from Chuan 35050. A very significant taste QTL, *QStas.sdau-4A.1* and positive QTLs for stickiness and total score also on chromosome 4A came from Shannong 483 \{10647\}

### 31. Grass-Clump Dwarfness/Grass Dwarfness
Complementary dominant genes. Genotypes producing dwarfness: \( D1-D2-D3-, \ D1-D2D2, \ D1-D4-D3-, \ D1-D2-D4 \) and \( D1-D4D4 \). 

\( D1 \): \( \{534\} \). \( G \{972\} \), 2D\{534,939,1595\}, 2DS\{942\}. \( s \): CS\(^*\)7/Kenya Farmer \( 2D\{1000\} \); CS\(^*\)6/Timstein 2D\{534\}. \( v \): Big Club\{534\}; Burt\{1000\}; Federation\{942\}; Mus\{534\}; Ramona 50\{358\}; Selection 1403\{1000\}. \( v2 \): Hermsen's pure-breeding dwarf \( D2\{1000\} \); Falcon \( D3\{1172\} \); Gabo \( D3\{944\} \); Timstein \( D3\{534\} \); Metzger's pure-breeding dwarf \( D2D3\{1000\} \). 

\( D2 \): \( \{534\} \). \( Bi \{972\} \), 2B\{536,574\}, 2BL\{944\}. \( s \): CS\(^*\)7/Cheyenne \( 2B\{1000\} \); CS\(^*\)4/Red Egyptian \( 2B\{1000\} \). \( v \): Bezostaya \{1595\}; Crete-367\{1029\}; Desprez 80\{1595\}; Florence\{1000\}; Kenya W744\{944\}; Loro\{1172\}; Mara\{1595\}; Marquis\{1000\}; Poros\{1595\}; Redman\{534,1001\}; Riebesel\{534\}; Tobari \{358\}. \( v2 \): Hermsen's pure-breeding dwarf \( D1\{358\} \); Cheyenne \( D3\{1000\} \); Metzger's pure-breeding dwarf \( D1D3\{1000\} \). 

\( D3 \): \( \{534\} \). \( A \{972\} \), 4A\{534,1595\}, 4AL\{939\}. \( s \): CS\(^*\)6/Timstein 4A\{534,1000\}. \( v \): Amby \( D1\{358\} \); Falcon \( D1\{1172\} \); Gabo \( D1\{944\} \); Kenya Farmer \( D1\{1000\} \); Timstein \( D1\{534\} \); Metzger's pure-breeding dwarf \( D1D2\{1000\} \). 

\( D4 \): \( \{1000\} \), 2D\{1000,1595\}, 2DL\{1598\}. \( s \): CS\(^*\)7/Cheyenne 2D\{1000\}. \( v2 \): Cappelle-Desprez \( D2\{1595\} \); Cheyenne \( D2\{1000\} \); Brevor \( D2\{1000\} \). 

\( d1d2d3d4 \). \( v \): Chinese Spring\{534,1000\}. 

Genotype lists in can be found in \{358,534,972\}. The effects of multiple allelism at \( D2 \), and possibly at \( D1 \), and modifying genes were demonstrated \{1595\}. Knott \{683\} described a lethal dwarf condition controlled by a dominant gene closely linked with \( Sr30 \) (chromosome 5D) in Webster and a complementary recessive gene in LMPG. Phenotypes resembling grass clump dwarfs in hybrids carrying a 2BL.2RS translocation were reported in \{916\}. The complementary gene \{s\} in wheat was not \( D1, D2 \) or \( D3 \). The effect was suppressed at high temperature.

32. Grain Weight 

QTL : Variation at locus \( QGwl.ccsu-1A \), associated with \( Xwmc333-1A \), accounted for 15% of the variation in a RIL population from RS111/CS \{0165\}. 

Rye Selection 111 (high GW)/CS (low GW) RIL: two definitive QTLs \( QGw.ccsu-2B.1 \) and \( QGw.ccsu-7A.1 \) and one tentative QTL, \( QGw.ccsu-1A.1 \), were detected by CIM analysis \{10363\}. The chromosome 7A QTL co-located with a QTL for early heading \{10363\}. 

\( QGwl.inra-2B \{10071\}. \( v \): Renan/Recital; favourable allele from Renan \{10071\}. \( R^2=10.7-19.7\% \) \{10071\}. \( ma \): \( Xgwm374-2B-Xgwm388-2B \{10071\} \). 

\( QGwl.inra-5B \{10071\}. \( v \): Renan/Recital; favourable allele from Recital \{10071\}. \( R^2=4.9-10.4\% \) \{10071\}. \( ma \): \( Xgwm639-5B - Xgwm604-5B \{10071\} \). 

\( QGwl.inra-7A \{10071\}. \( v \): Renan/Recital; favourable allele from Recital \{10071\}. \( R^2=5.2-10.3\% \) \{10071\}. \( ma \): \( Xcfa2049-7A - Xbcd1930-7A \{10071\} \). 

33. Growth Rate and Early Vigour 

QTL analyses in \( Ae. tauschii \): chromosomes 1D, 4D, and 7D carried QTLs for relative growth rate, biomass allocation, specific leaf area, leaf area ratio, and unit leaf rate. Chromosome 2D had QTLs for rate and duration of leaf elongation, cell production rate, and cell length. Chromosome 5D harbored QTLs for total leaf mass and area, number, and growth rate of leaves and tillers \{10293\}.

35. Hairy Glume

Hg 1494. 1A 1293, 1AS 947. 

i: S-615∗11/Jones Fife 1500. 

s: CS∗7/Indian 1A 1293. 

v: A well-known, widespread and easily identified dominant marker - few examples will be listed. 

Indian 1293; Jones Fife 1494; Prelude 1494. 

itv: LD222∗11/T. Turgidum var. durum melanos 1546. 

tv: Golden Ball 1342, 1494. 

dv: T. monococcum lines 1494. 

ma: Xutv1391-1A (distal) - 3 cM - Bg - 1.6 cM - Hg - 2.4 cM - Glu-A1 (proximal) 9959; Tel..........Hg/BG605525 - 3.8 cM - Xpsp2999(Glu3)-1A 10193. 

A 1A gene controlling hairy glumes was mapped in a cross between durum cv. Messapia and T. turgidum ssp. dicoccoides acc. MG4343 9959. 

HgI 1405. v: Ulyanovkn 1405; Pionerskaya 715, 1405. 

Evidence for multiple alleles in T. monococcum is given in 744. 

The likelihood of three alleles, hg (hairless), HgI (weakly hairy) and Hg (very hairy), with hg1 being recessive to Hg and causing a short (weak) hairy phenotype, was mentioned in 1405. 

36. Hairy Leaf

Hl1 0316. Weakly hairy. [Hl 884]. 4B 884, 4BL 760. 

v: Artemovka 925; Caesium 111 925; Lutescens 53/12 925; Lutescens 62 925; Milturum 321 884; Poltavka 925; Pyrotrix 28 925; Saratov 321 884; Saratovskaya 29 884, 760; Sarrubra 925. 

ma: Xgwm375-4B - 12.1 cM - Hl1 - 2.1 cM 10516. 

Hl2 0316. 7BS 0316. 

v: Hong-mang-mai 0316. 

The hairy leaf gene (HlAesp) in Ae. speltoides introgression line 102/001 was allelic with Hl2 10516. 

hl1 hl2. v: Chinese Spring 884. 

Kuspira et al. 744 provided evidence for at least three alleles at an Hl locus in T. monococcum. 

A QTL analysis of the ITMI population identified loci determining hairiness of leaf margins and auricles in regions of chromosomes 4B and 4D orthologous ot HlI 10516. 

37. Hairy Leaf Sheath

Levy & Feldman 795 concluded that complementary genes determined hairy leaf sheath in T. dicoccoides. 

Hs 795. [Hs 761]. 

v: Certain hexaploid derivates of G25 produced in Israel 939. 

tv: T. dicoccoides G25 761. 

hs. v: Most hexaploid wheats 939. 

tv: T. dicoccoides G7 761. 

38. Hairy Neck/Pubescent Peduncle
39. Hairy Node/Pubescent Node

Inheritance of hairy (glabrous) node versus non-hairy node was attributed to a single, dominant gene difference \{396,837,910,914\} and the \(Hn/hn\) locus was shown to be linked with \(B1\) (awn inhibitor). Observations on 5A trisomics and telosomics of Chinese Spring confirmed this location. Love & Craig \{837\} studied a cross involving Velvet Node CI 5877, and Gaines & Carstens \{396\} studied an offtype single plant designated Velvet Node Wash. No. 1981.

\(Hn\).
- 5AL. \(v:\) Aurore\{722\}; Fylgia\{722\}; Extra-Kolben II\{722\}; Marquis\{910\}; Tammi\{765\}; \(T.\) vulgare erythrospermum\{910\}. \(tv:\) \(T.\) polonicum vestitum\{910\}.
- 5BS\{1298\}. \(v:\) Garnet\{722\}; Kimno\{722\}; Pika\{722\}; Timantii\{722\}.

Levy & Feldman \{795\} concluded that complementary genes determined hairy leaf sheath in \(T.\) dicoccoides. Multiple alleles were reported in \(T.\) monococcum\{744\}.

40. Heat tolerance

QTL: QTLs contributing to grain-filling duration (GFD) under high temperatures were associated with \(Xgwm11-1BS\) (11% of variability) and \(Xgwm293-5AS\) (23% of variability) in Ventnor (tolerant) // Karl 92 (Non-tolerant) \{0327\}.

41. Height

\(Ht\) is the general symbol.

41.1. Reduced Height : GA-insensitive

\(Rht-1\{371,0019\}\). The \(Rht-1\) homeoloci are orthologous with the \(D8\) locus in maize and the \(GAI\) locus in \(Arabidopsis\). They encode proteins resembling nuclear transcription factors and are involved in sensing gibberellin levels \{0019\}. Common wheat and durum NIL pairs are listed in \{02102\}.

\(Rht-A1a\{0019\}. \(v:\) Chinese Spring\{0019\}; All wheats are assumed to be monomorphic.

### 42. Herbicide Response

#### 42.1. Difenzoquat insensitivity

**Dfq1** \{1396\}. Insensitive. 2B\{1396\}.2BL\{789\}. \textbf{v}: CS\{1396\}.

**dfq1**. Sensitive. \textbf{s}: CS 6/Ciano 67 2B\{1396\}; CS*7/Marquis 2B\{789\}; CS*/Sicco 2B\{1396\}.

Busch \textit{et al.} \{153\} reported a single dominant gene for tolerance of Era and Marshall compared with the susceptibility of Eureka and Waldron, but its relationship to \textit{Dfq1} is unknown.

#### 42.2. 2,4-D tolerance

Randhawa \textit{et al.} \{1190\} reported a single dominant gene in each of WL711, CPAN1874 and CPAN1922 controlling tolerance. HD2009 and PBW94 were described as susceptible.

#### 42.3. Chlortoluron Insensitivity

**Su1** \{1402\}. Insensitive. 6B\{1402\}.6BS\{799\}. \textbf{v}: Cappelle-Desprez\{1402\}. \textbf{tv}: B-35\{735\}.

**su1**. Sensitive. \textbf{v}: Chinese Spring\{1402\}; Poros\{1402\}. \textbf{tv}: B-7\{735\}. \textbf{ma}: Xpsr312-6B - 5.3 cM - Su1 - 6.8 cM - Xpsr477(Pgk2)-6B\{736\}. \textbf{ma,tv}: Nor2 (6BS) - 2.7 cM - Su1\{1401\}; Su1 - 5.2 cM - Xpsr371-6B (6BL)\{735\}.

Su1 also controls insensitivity to metoxuron \{1402\}.

A single dominant gene for tolerance to isoproturon was found in tetraploid wheats derived from a tolerant \textit{T. monococcum} source \{1044\}. This gene is presumably different from \textit{Su1}.

#### 42.4. Imidazolinone resistance

Resistance alleles found in mutagenized populations were incompletely dominant and additive in effect \{10099\}. Resistance is due to single base pair changes in acetohydroxyacid synthase.

**Imi1** \{10099\}. \{AhasL-D1\{10101\},Fs-4\{10100\}\}. \textbf{v}: BW755 = Grandin*3/Fidel-FS-4\{10099\}; CDS Teal IMI 1A\{10099\}; CDC Teal IMI 9A\{10099\}; CDC Teal IMI 10A = Fidel-FS-2\{10099\}; Clearfield WHS Janz = Janz*4/Fidel-FS-2; Clearfield WHS Stiletto = Stiletto*3//Spear/ Fidel-FS-3; Fidel-FS-2 = ATCC40997\{10100\}. \textbf{v2}: CDC Teal IMI 15A = PTA 3955 Imi3\{10099\}.

**Imi2** \{10099\}. \{AhasL-B1\{10101\}\}. \textbf{v}: CDC Teal IMI 11A=PTA 3953\{10099\}.

**Imi3** \{10099\}. \{AhasL-A1\{10101\}\}. \textbf{v2}: CDC Teal IMI 15A Imi3\{10099\}.

\textbf{dv}: \textit{T. monococcum} mutant EM2 (mutant of susceptible line TM23 \{10102\}).

Mutant EM2 has a serine to asparagine substitution near the carboxyl end of the enzyme. The same change led to imidazolinone resistance in hexaploid wheat, rice and \textit{Arabidopsis} \{10102\}.

### 43. Hybrid Weakness
43.1. Hybrid necrosis

[Progressive lethal necrosis {155}; Firing {971}].

Complementary dominant genes. Descriptive alleles \( w \) (weak), \( m \) (medium) and \( s \) (strong) were allocated by Hermsen {532}. Phenotype is affected by modifying genes (and/or genetic background) and environment {566}. According to Dhaliwal et al. {257} progressive necrosis is suppressed at 28°C.

\[ \text{Ne1}{\{530\}}. \quad \text{Le}{\{155,550\}}, \text{F}{\{971\}}, \text{Le1}{\{1491\}}. \quad \text{5B}{\{1491\}}, \text{5BL}{\{1636\}}. \quad \text{ma: Xbarc216-5B - 8.3 cM - Ne1 - 2 cM - Xbarc74-5B}{\{10334\}}. \]

43.2. Hybrid chlorosis type I

Ch1{535}. [m^a\{1245\}]. 2A\{538,939\}. i: Steinwedel^2/Khapli\{939\}; T. macha var. colchicum\{535\}. v: T. macha var. subletschumicum\{1245,1493\}. tv: Khapli\{1080,1549\}; T. dicoccoides var. kotschyanum\{535\}; T. dicoccoides var. straussianum\{535\}.
36 group dicoccon wheats are listed in \{697\}.

Ch2{535}. [m^b\{1245\},Ne3\{1504\}]. 3D\{1495,1504\}.3DL\{692,939\}. v: Chinese Spring\{535,1504\}; T. vavilovi.
Extremely widespread, very few wheats lack this gene.
Allelic variation at the Ch2 locus was suggested \{537,1000\}. Prelude, Reward and Red Bobs were exceptional in producing severe symptoms and death at an early stage. Konosu 25 may carry a weak allele \{1000\}. Different alleles in C306 (strong) and Sonalika (medium) were suggested in \{697\}.

ch1 ch2. v: Albit\{1000,1509\}; Burt\{1000,1509\}; Chancellor\{1000\}; Garra\{1549\}; Kharkof\{535\}; Steinwedel\{1549\}. su: TAP 67 (= Pawnee 3Ag(3D))\{1644\}.
Lists appear in \{535, 697, 1381, 1473, 1474, 1475, 1496, 1497, 1502, 1503, 1512, 1505, 1506, 1507, 1508, 1509, 1510\}.
A gene, Chrl, in rye produces chlorosis symptoms in hybrids with wheats such as C306, HD2939 and Nil5439 possessing Ch2 \{1472\}. Evidence for multiple alleles of Chrl was also presented \{1472\}.

Chrl\{1472\}. dv: Cereal rye lines, EC179188 = WSP527A\{1472\}; EC143825 = WSP506A\{1472\}; EC338685 = Blanco\{1472\}; others\{1472\}.

chr1\{1472\}. dv: EC179178\{1472\}; EC179185 SAR/SWPY5\{1472\}.

43.3. Hybrid chlorosis

Cs1\{1511\}. [Ch1^c]. 5A\{1498\}. v: T. dicoccum cv. Hokudai\{1511\}.
Occurs at high frequency in the T. paleocolchicum group of emmers.

Cs2\{1511\}. [Ch1^c\{1501\}]. 4G\{1498\}. tv: Many accessions of T. timopheevii and T. araraticum\{637,1511\}.
Multiple allelism at the Cs2 locus is discussed in \{637\}.

43.4. Apical lethality

Apical lethality is caused by complementary recessive genes and is characterized by stunting and tiller death at the 4-5 leaf stage. The lethal genotype was designated apd1 apd1 apd2 apd2 \{10492\}.

Apd1 \{10492\}. v: WR95 = Kalyansona/Gigas//HD1999/Sonalika/3/T. carthlicum\{10492\}.
**Morphological and Physiological Traits**

$apd2\{10492\}$. \textit{v}: HD2009\{10492\}; HW2041\{10492\}; Lok-1\{10492\}; others\{10492\}.

$Apd1$ $Apd2$. \textit{v}: Atila\{10492\}; Kalyansona\{10492\}; others\{10492\}.

$apd1$ $apd2$. Lethal genotype.

Uniculm plants occurred as heterozygous segregates among progenies, but homozygous uniculm lines could not be established \{10492\}.

44. Iron Deficiency

$Fe1\{921\}$. 7DL\{927\}. \textit{v}: Saratovskaya 29\{921\}.

$Fe2\{921\}$. 7BS\{927\}. \textit{v}: CS\{927\}.

45. Lack of Ligules

The liguleless character is controlled by complementary recessive genes in hexaploid wheat \{077,738,942\} and by a single recessive in tetraploid wheat \{047,050,939,10133\}. One gene at the tetraploid level is allelic with one of those in the hexaploid \{939,10133\}. Evidence for orthology of $lg1$ and $lg2$ with $lg$ of rice \{170\}, $lg1$ of maize \{004\}, $li$ of barley \{1155\} and $al$ of rye was presented in \{725\}. \textit{al}: Imperial rye chromosome 2R restored the liguled condition to a liguleless CS derivative \{939\}.

$lg1\{047\}$. 2B\{942\}.2BS\{10767\}. \textit{i}: ANK33=Novosibirskaya 67*10/K59990\{10061\}. \textit{v}: Eligulate W1342 $lg2$ $lg3\{942,10133\}$; K31289\{10133\}; K59990\{10061\}; K53660\{10133\}; Liguleless partial backcross derivative of CS\{939\}; Partial backcross derivative of CS\{939\}. \textit{tv}: K17769\{10133\}; K17784\{10133\}.

$lg2\{942\}$. \textit{i}: ANK33 = Novosibirskaya 67*10/K59990. \textit{v}: Eligulate W1342 $lg1$ $lg3\{942,10133\}$; Liguleless partial backcross derivative of CS\{939\}. Because diploid wheats are liguled, polyploid wheats presumably carry a third recessive factor in chromosome 2A.

$lg3\{10133\}$. 2A\{10133\}. \textit{i}: ANK33=Novosibirskaya 67*10/K59990\{10061\}. \textit{v}: Present in all hexaploid cultivars.

Genotypes of selected tetraploid wheat \{10133\}

50.2. Sterility in hybrids with wheat

Shw\{0331\}. [1HL\{0331\}]. \textbf{ad:} Additions of 1H and 1HL to wheat and certain translocation lines {0331}. \textbf{ma:} Located in a 16.4 cM interval flanked by Xmwg800-1H and Xmwg943-1H. A possible relationship with Ncc genes is discussed {0331}.

50.3. Photoperiod and/or temperature-sensitive male sterility (PTGMS)

\textit{wtms1}\{10332\}. 2B{10332}. \textbf{v:} BNY-S{10332}. \textbf{ma:} E: AAG/M:CTA\textsubscript{163} - 6.9 cM - \textit{wtms1} - 4.8 cM - Xgwm374-2B\{10332\}.

Described as a thermo-sensitive gene (TGMS), giving complete sterility at less than 10C, but fertile at higher temperatures {10332}.

\textit{wptms1}\{10333\}. 5B{10333}. \textbf{v:} Line 337S wptms2\{10333\}. \textbf{ma:} Xgwm335-5B - 4.2 cM - \textit{wptms1} - 24.4 cM - Xgwm371-5B\{10333\}.

\textit{wptms1} produces sterility only in the presence of \textit{wptms2}.

\textit{wptms2}\{10333\}. 2B{10333}. \textbf{v:} Line 337S \textit{wptms1}\{10333\}. \textbf{ma:} Xgwm374-2B - 6.9 cM - \textit{wptms2} - 20.9 cM - Xgwm120-2B\{10333\}.

\textit{wptms2} produces sterility only in the presence of \textit{wptms1}. \textit{wptms1} and \textit{wptms2} were analysed and mapped under long photoperiod/high temperatures, but an earlier study indicated a single gene for male sterility under short photoperiod/low temperatures. Althought mapping data are different a possible relationship between \textit{wtms1} and \textit{wptms2} needs to be resolved.

51. Manganese Efficiency

\textbf{QTL:} Variation associated with Xcdo583-4B explained 42% of the variation for Mn efficiency in the durum cross Stojoci 2 (Mn efficient)/Hazar (MN inefficient) {0320}.

52. Maturity time

\textit{QMat.crc-3B}\{10287\}. 3B\{10287\}. \textbf{ma:} Linked to Xwmc231-3B (LOD 3.0) in RL4452/AC Domain\{10287\}.

\textit{QMat.crc-4A}\{10287\}. 4A\{10287\}. \textbf{ma:} Linked to Wx-B1 (LOD 6.1) in RL4452/AC Domain\{10287\}.

\textit{QMat.crc-7D}\{10287\}. 7D\{10287\}. \textbf{ma:} Linked to Xgwm130-7D (LOD 17.5) in RL4452/AC Domain\{10287\}.

53. Megasporogenesis

53.1. Control of megasporogenesis

\textit{Msg}\{625\}. 7AS\{625\}. \textbf{tv:} Langdon\{625\}.

54. Meiotic Characters

54.1. Low-temperature pairing

\textit{ltp}\{527\}. \textbf{v:} Chinese Spring\{527\}.

Expressed in the absence of chromosomes 5D at 12°C - 15°C, but not at 20°C. A contrasting allele, \textit{Ltp}, for normal pairing at the lower temperature range was demonstrated in \textit{T. dicoccum}. 

54.2. Pairing homoeologous

**Ph1**{1537}.  5BL{1301}.  **ma**: PCR-based assays for presence and absence of **Ph1** have been described{0214,0217,9965,0359}; The **Ph1** factor(s) was restricted to a region flanked by Xrgc846-5B and Xpsr150-5B{0219}; **Ph1** was physically mapped in 5BL to fraction length 0.55, bracketed by deletions 5BL-1 and **ph1b**{446}.

A complex **Ph1** candidate structure comprising at least one 5B-specific member of the cdc2 complex multigenic cluster (involved in chromosome condensation), a unique repeat structure with similarities to repeats on chromosome 3B, and a heterochromatic sub-telomeric insertion from chromosome 3AL was identified {10240}.

**ph1a**. - Not applicable - see **ph2b** {1303}.

**ph1b**{1301}.  **v**: Sears' high pairing mutant{1301}.  **ma**: A PCR-based detection system for **ph1b** individuals is described in {9965}.

**ph1c**{593}.  **tv**: Cappelli **ph1** mutant{449,593}; This mutant is deficient for a terminal portion of chromosome 5BL{449}.  **ma**: Mutant lines with **ph1b** and **ph1c** carry deletions of the chromosome segment possessing **Ph1** in the respective parent lines{593,447}.

Several **ph1** mutants are described in {0219}.

**Ph2**{1302}.  3DS{1302}.

**ph2a**{1302}.  **v**: Sears' intermediate pairing mutant{1301,1302}.

**ph2b**{1304,1303}.  [**ph1a**{1537}].  **v**: Chinese Spring mutant 10/13{1537}.

54.3. Inhibitor of pairing homoeologous

**Ph1I**.  **al**: *Aegilops speltoides*{1218,439}.

55. Nitrate Reductase Activity

**Nra**{424}.  **v**: UC44-111{424}.

**nra**{424}.  **v**: Anza{424}.

56. Nuclear-Cytoplasmic Compatability Enhancers

**scs**{869}.  Derived from *T. timopheevii*{869}.  **[scs]**{10878}.  1AL{870,027}.  **v**: *T. timopheevii*{869}.  **ma**: A number of completely linked RAPD markers were identified{044}; **Xbcd1449.2-1A** - 0.6 cM - **scs** - 2.3 cM - **Xbcd12-1A**{10878}.

Asakura *et al*. {044} used the symbol **Ncc** as a synonym for **scs** pointing out that the effects of the gene are not limited to a single species.

57. Nucleolus Organizer Regions

57.1. 18S - 5.8S - 26S rRNA genes

NORS have been observed as secondary constrictions associated with nucleoli on satellited chromosomes {e.g., 221}, and by in situ hybridization to chromosome spreads {039,294,1014} of 18S-5.8S-26S ribosomal-DNA probes {038,433}. Allelic variation in gene number has been demonstrated at all wheat **Nor** sites and at **Nor-R1** by filter {367} and in situ hybridization {1012}. Allelic variants of the **Nor** loci are detected by hybridization of rDNA probes to restriction endonuclease-treated DNA on Southern blots {037,288,917,1399}. Alleles **Nor-B2a** to **Nor-B2f** were identified using Taq1 digests of genomic DNAs hybridized
to derivatives of the plasmid pTa250 {433} containing spacer-DNA fragments pTa250.4 {367,917} and pTa250.15 {288}.

Other variants may have been isolated {1399} using BamHI/EcoRI double digests and pTa71 {433}. The variants may or may not be equivalent to those described below.

**Nor1a and Nor2a.** v: Maris Huntsman{1399}.

More detailed listings for allelic variation at Nor-B1 and Nor-B2 are given in {917,918}. Two sites designated temporarily as Nor-Ax and Nor-Ay were identified in T. monococcum ssp. boeoticum, but were absent in ssp. urartu.

58. Osmoregulation

Osmoregulation is a specific form of solute accumulation regulating turgor pressure and hydration during periods of stress with positive effects on growth. Wheat lines selected for higher osmoregulation in the greenhouse have greater growth and seed yields under water limited conditions in the field.

**Or**{1030}. Low osmoregulation. **s**: CS (Red Egyptian 7A). **v**: Cappelle Desprez; Condor*4/3Ag14{1030}; Red Egyptian. **ma**: Or (proximal in 7AS) - 13 cM - Xpsr119-7A{1031}.

**or**{1030}. High osmoregulation. 7A{1030}.7AS{1031}. **v**: CS, Condor, Songlen, Takari{1030}.

59. Phenol Colour Reaction of Kernels

Wheat genotypes vary in response when caryopses are treated with weak solutions of phenol, a dark colour response being indicative of a positive response. This response is believed to be related to the action of tyrosinase. There seems to be a genetic relationship with polyphenol oxidase activity which causes a darkening of flour, pasta and noodle products (see also Polyphenol Oxidase (PPO) activity).

**Tc1**{10130}. 2AL{10130,10131}. **su**: Various substitutions of chromosomes 2A into CS{10131}. **sutr**: Langdon*/dicoccoides 2A{10130}. **tv**: Golden Ball{10130}.

Lines with a negative phenol colour reaction.

60. Pollen Killer

**Ki**{1306}. Killing allele is dominant. 6BL{1306}. **v**: Chinese Spring{1306}; Mentana{929}.

**ki**. **v**: Probably the majority of wheats including Timstein, Gabo and Yalta{1306}.

Modifiers also appear to be involved as Luig {840, and unpublished} found variation among kiki parents. Some F2 and F3 Sr11sr11 plants from Yalta/Chinese Spring crosses segregated with less than 50% Sr11- phenotypes among the progeny indicating that killing extended to eggs as well as pollen. See also, Gametocidal Activity.

Kato & Maeda {10164} reported both partial pollen and seed sterility in crosses involving certain landraces and Chinese Spring. They attributed sterility to recessive alleles of three
complementary genes. The genes were designated \textit{Ki2}, \textit{Ki3} and \textit{Ki4} \cite{10164}, but the relationship of \textit{Ki3} to the earlier designated \textit{Ki} was not established. Some genotypes:

\textbf{\textit{Ki2} \textit{Ki3} \textit{Ki4}}: v: Aka Kawa Aka \{10165\}; Hope \{10165\}; Marquis \{10165\}; Red Russian \{10165\}

\section*{61. Polyphenol Oxidase (PPO) Activity}

3,4 dihydroxyphenylalanine (L-DOPA) was used as a substrate in a non-destructive test of polyphenol oxidase activity in seeds. Chromosome 2D was shown to carry PPO gene(s) based on Langdon/Chinese Spring (2D) substitution lines and nullisomic-tetrasomic analysis \{0342\}. An orthologous series of genes affecting PPO activity in both common wheat and durum was proposed in \{10149\}. See also, Phenol Colour Reaction of Kernels

\begin{itemize}
\item Chara (mod high)/WW2449(low): DH population: PPO activity Associated with \textit{Xgwm294b}-2A (\(R^2=0.82\)), \textit{Xwmc170}-2A, \textit{Xgwm312}-2A and \textit{Xwmc178}-2A (\(R^2>0.7\)) \{10410\}.
\end{itemize}

\begin{itemize}
\item Chara (medium high PPO)/WW2449 (low PPO): one QTL was located on chromosome 2A. Two markers (one SNP, one CAPS) based on BQ161439 were polymorphic between the parents and showed linkage or allelism with PPO loci \textit{Xtc1} and \textit{XPPO-LDOPA}. \textit{Xtc1} - 0.6 cM - \textit{XPPO-LDOPA}/\textit{XPPO18}/BQ161439 \{10484\}.
\item A QTL on 2D, associated with \textit{Xfba314}-2D was identified in an M6 / Opata 85 population using the L-DOPA assay. The high PPO activity was contributed by M6 \{0344\}. Markers significantly associated with PPO activity were also detected on chromosomes 2A, 2B, 3B, 3D and 6B in the population NY18 / Clark's Cream \{0344\}.
\end{itemize}

A multiplex of markers \textit{PPO33} and \textit{PPO16} was reliable for selecting genotypes with low PPO activity \{10418\}.

\textbf{Tetraploid wheat}

Messopia/\textit{T. dicoccoides}: RILs: Associated with RFLP \textit{Xutv1427-2A} \{10411\}.

Jennah Khetifa (high)/Cham 1 (low): Associated with \textit{Xgwm312-2AL} \{10411\}. STS marker PPO18 based on a polyphenol oxidase (\textit{PPO}) gene (GenBank AY596268) was closely linked to SSR markers \textit{Xgwm312} and \textit{Xgwm294} on chromosome arm 2AL. PPO18 explained 28-43% of the variation in PPO activity in the cross Zhongyou 9507/CA9632 \{10290\}.

\section*{62. Red Grain Colour}

Red colour is probably due to the polyphenol compounds phlobaphene or proanthocyanidin, synthesized through the flavanoid pathway. Himi & Noda \{10107\} provided evidence that
the R genes were wheat forms of Myb-type transcription factors (*Tamyb10-3A, Tamyb10-3B, Tamyb10-3D*). Genetic evidence is provided in {10838}.

Red colour is dominant to white. At each locus, the white allele is assigned *a* and the red allele, *b*. White-grained *T. aestivum* and amber-grained *T. durum* wheats carry recessive *a* alleles at each locus. White-grained CS*7/Kenya Farmer and CS*6/Timstein are considered near-isogenic to CS with *R-D1b*.

**R-A1a**. **ma**: Based on *Tamyb10-A1* sequences this allele in CS lacks the ability to bind DNA due to deletion of the first half of the R2 repeat of the MYB domain {10838}; The *R-A1a* allele in Norin 17 has a 2.2 bp insertion in the second intron that appears to prevent transcription {10838}.

**R-A1b**. **i**: Novosibirskaya 67*9/Solo* {730}. **v**: Baron {370}; Diamant 2 {014}; Hustler {370}; Norin 10- Brevor, 14 {017}; Maris Widgeon {370}; Mercia; {370}; Motto {370}; Red Bobs {1003}; Sapphire {370}; Sleipner {370}; Talent {370}; Wembley {370}.

**R-B1a**. **ma**: Based on the *Tamyb10-B1* sequence this allele in CS has a 19 bp deletion of the CCG repeat region causing a frameshift mutation {10838}.

**R-D1** {549}. **i**: Novosibirskaya 67*9/CS* {730}. **v**: Canon {370}; Dollar {370}; Grana {370}; Supreme {370}.

**R-D1a**. **ma**: No *Tamyb10-D1* sequence was detected in lines with this allele indicating that it may be a deletion {10838}.

**R-D1b**. **i**: Novosibirskaya 67*9/CS* {730}. **v**: Alexandria {370}; Apollo {370}; Axona {370}; CS {1293}; Dwarf A {370}; Fortress {370}; Jerico {370}; Longbow {370}; Luna {370}; Mardler {370}; Maris Huntsman {370}; Minaret {370}; NFC 75/93/27A; Rapier {370}; Pawnee {549}; Voyage {370}; Vuka {370}.

Functional markers based on *Tamyb10* sequences are given in {10838}.

**63. Reaction to Black-Point of Grain**
Black-point, a common grain defect, is a dark discoloration of the embryo region of the kernels. Whereas black-point is often attributed to infection by a number of fungi, the presence of such fungi may be a consequence of saprophytic colonization of affected tissues rather than the cause (see {10148} for references). The condition may be triggered by high humidity {0845}.

QTL: Sunco/Tasman DH population: QTL located in chromosomes 2B (15% of phenotypic variation), 3D, 4A (from Sunco) and 1D, 5A and 7AS (from Tasman {10148}. The 2B gene was associated with the presence of Sr36 {10148}.

Markers Xgwm319-2B and Xgwm048-4AS were confirmed in a Batavia/Pelsart (resistant) DH population {10494}.

Cascades/AUS1408 DH population: QTL from Cascades located in chromosomes 2D (5 cM from Xgwm484-2D, 18% of phenotypic variation), 2A (13%), and 7AS (12%) {10148}.

64. Response to Photoperiod

One-gene {1169} and two-gene {638,1137,1170} differences were reported in inheritance studies. In Chinese Spring/Hope substitution lines for chromosomes 1A, 4B and 6B greater sensitivity to short photoperiod was found, whereas substitutions of 3B and 7D were less sensitive {487}.

'a' alleles are dominant.

There is an orthologous gene series on the short arms of homoeologous group 2. The "a" alleles confer the insensitive response {0063}, the contrasting allele may be referred to as "b".

Ppd-A1{0063,10612}.  [Ppd3{1141}].  2AL{1268}.  v: C591{0057}.  tv: GS100, Kofa (1027-bp deletion in the promoter){10612}; GS105, Seveo (1117-bp deletion in the promoter){10612}; A survey of Ppd-A1 allele is reported in {10915}.  ma: Xwmc177-2A - Ppd-A1, 2.2 and 2.8 cM in GS100/GS101 and GS105/GS104, respectively{10612}.

GS100 and GS105 had different deletions relative to GS101 and GS104, respectively and both were consistently a few days earlier flowering than their near-isogenic counterparts with Ppd-A1b {10612}.

Ppd-A1a{10612}.  tv: GS100{10612}; GS105{10612}.

Ppd-A1a was present in 39% of Chinese landraces and 97% of improved cultivars {10622}. GS100 and GS105 had different deletions relative to GS101 and GS104, respectively and both were consistently a few days earlier flowering than their near-isogenic counterparts with Ppd-A1b {10612}.

Ppd-A1b{10612}.  tv: GS101{10612}; GS104{10612}.

According to {10611} the Ppd-B1 allele from Japanese wheats has a stronger effect than the allele from CS.

Varieties with the photoperiod insensitive allele have more than one Ppd-B1 copy per chromosome 2B: two copies in Recital, three copies in Sonora 64, Timstein and C591, and 4 copies in Chinese Spring{10881}.

Ppd-B1b{10611,10881}.  v: Beaver{10881}; Cappelle-Desprez{10881}; Cheyenne{10881}; Norstar{10881}; Paragon{10881}; Renan{10881}.  v2: Haruhikari Ppd-D1b{10611}.

Varieties with the photoperiod sensitive allele have a single Ppd-B1 copy per chromosome 2B{10881}.
**Morphological and Physiological Traits**

**Ppd-B2**{10628}. 7BS{10628}. su: Favorit (F26-70 7B){10628}. v: F26-70{0093}. ma: Xgwm255-7B - 20.7 cM - Ppd-B2 - 4.4 cM - Xgwm537-7B{10628}. This gene confers earlier flowering under long photoperiod conditions {10628}.

**Ppd-D1.** Comparative mapping showed that Ppd-D1 was co-linear with barley Ppd-H1 - a member of the pseudo-response regulator (PRR) gene family {10466}. Jagger amplified the 414 bp band {10466} associated with daylength sensitivity whereas 2174 amplified the 288 bp band associated with insensitivity {10722}.

67. Response to Vernalization

The requirement for vernalization is particularly important for winter cereals to avoid cold injury of the sensitive floral organs during the winter. In wheat, vernalization requirement is controlled by four major genes designated $Vrn-1$, $Vrn-2$, $Vrn-3$, and $Vrn-4$. The first three genes were identified using map-based cloning approaches {10014, 10299, 10421}. The $Vrn-1$ gene encodes a MADS-box transcription factor closely related to the Arabidopsis API/FRUITFULL family, responsible for the transition of the shoot apical meristem from the vegetative to reproductive stage in wheat {10014}.

Deletions in the promoter ($Vrn-A1a$, $Vrn-A1b$) {10198} or the first intron of this gene ($Vrn-A1c$, $Vrn-B1a$, $Vrn-D1a$) {10202} are the most common sources of spring growth habit among landraces and commercial cultivars of polyploid wheat worldwide {10617,10695,10709}.

The $Vrn-2$ locus produces two linked and related proteins designated ZCCT1 and ZCCT2, characterized by the presence of a putative zinc finger and a CCT domain {10299}.

Deletions and mutations involving both the ZCCT1 and ZCCT2 genes are frequent in diploid wheat and are associated with recessive alleles for spring growth habit {10299}.

Among the cultivated tetraploid and hexaploid wheat species the $Vrn-B2$ gene is generally functional whereas the $Vrn-A2$ gene is not {10710}. At least one functional copy of $Vrn-2$ combined with homozygous recessive alleles at all three $Vrn-1$ loci is required to confer winter growth habit in hexaploid wheat.
The Vrn-B3 locus (formerly known as Vrn-5 or Vrn-B4) is homologous to the Arabidopsis FT gene \{10421\}. This dominant allele, found in the variety Hope, is associated with the insertion of a transposable element in the Vrn-B3 promoter. Natural variation at the Vrn-A3 and Vrn-D3 loci has been also described in hexaploid wheat \{10533\}. Vrn-3 promotes the transcription of Vrn-1 and accelerates flowering \{10421\}.

The Vrn-D4 allele for early flowering was originally identified in the Australian cultivar Gabo \{671\} and was backcrossed into Triple Dirk to develop the isogenic line TDF \{1172\}. This locus was mapped on the centromeric region of chromosome 5D between markers Xcfd78 and Xbarc205 \{10711\}. Natural variation for flowering time at the centrometric region of homoeologous group5 chromosomes has been found, so far, only in the D genome. Incorrect TDF seed stocks generated initial confusion about the existence of Vrn-D4 but molecular markers are now available to separate the incorrect stocks \{10711\}. Using genetic analyses, Iwaki et al. \{10003\} found the Vrn-D4 allele for spring growth habit occurred with a higher frequency in India and neighboring regions.

\textbf{Vrn-I} \{1398\}. Synonymous with TaVRT-1 \{10019\}

Orthologous series in long arms of chromosomes of homoeologous group 5. Vrn-I is a MADS-box gene similar to Arabidopsis APETALA1 \{10014\}. Spring types are associated with mutations in the promoter or the first intron \{10014, 10198, 10202, 10288\}. Reduction of Vrn-I transcripts in transgenic hexaploid spring wheat delays flowering \{10300\}.

A polymorphism between Jagger and 2174 was associated with vrn-A1a. A point mutation occurred in exon 4 \{10695\}; 17 of 19 genotypes surveyed, including Jagalene, carried the 2174 mutation and only Jagger and Overley carried the Jagger allele \{10695\}.

Vrn-I genotypes in Pacific Northwest USA wheats are listed in \{10695\}.

Dominant spring habit alleles at the Vrn-A1 locus

\textbf{vrn-A1.}

Copy number variation for vrn-A1 was detected in IL369 (2 copies) \{10202\}, Malacca (2 copies) and Heeward (3 copies). Higher copy number was associated with later flowering or with increasing requirement for vernalization (i.e. longer exposure to cold is needed to achieve full vernalization) \{10881\}.

\textbf{vrn-A1a} \{10198\}. vrn-A1a \{10198\} v: Claire\{10880\}; Triple Dirk C\{10880\}. v2: Chinese Spring \textit{Vrn-D1a}\{10880\}. c: GenBank AY616455\{10198\}.

\textbf{vrn-A1b} \{10881\}. v: IL369\{10202\}; Malacca\{10881\}. c: GenBank JF965396\{10881\}. This allele has two copies of the gene, possibly arranged in tandem although the physical structure is unknown. Both copies are distinguished from Chinese Spring \textit{vrn-A1a} by a SNP in exon 7 (T in Malacca, C in Chinese Spring). One copy also has a SNP in exon 4 (T in Malacca, C in Chinese Spring). Sequenced cDNAs from Malacca show that both copies are expressed. \{10881\}.

\textbf{vrn-A1c} \{10881\}. v: Hereward\{10881\}. c: GenBank JF965397\{10881\}. A comparison of Claire (\textit{vrn-A1a}), Malacca (\textit{vrn-A1b}) and Hereward (\textit{vrn-A1c}) indicated that increasing gene copy number is associated with lateness \{10881\}. Two winter alleles were identified based on an SNP in exon 4 \{10656\}.

Located mid 5A cosegregating with Xcdo504-5A, Xwgd44-5A and Xpsr426-5A{419}; Vrn-A1 - 0.8 cM - Xbcd450-5A/Xrz395-5A - 4.2 cM - Xpsr426-5A{9903}. Cultivars possessing Vrn-A1a are insensitive to vernalization. Vrn-A1a is epistatic to other genes. According to {1221}, Vrn-A1a is not always fully dominant and not always epistatic. Kuspira et al. {745} attributed single gene variation in *T. monococcum* to the Vrn-A1a locus. Multiple recessive alleles were suggested {745}. Vrn-A"m"1 was mapped on the long arm of chromosome 5Am closely linked to the same RFLP markers as Vrn-A1 {279}. Vrn-A"m"1 was mapped to the Xcdo504-5A - Xpsr426-5A region {0312}. In the opinion of the curators this location may not be correct. Multiple alleles also were reported in {9930}, and the dominant allele of Novosibirskaya 67 and the weaker dominant allele of Pirotrix 28 were designated Vrn1a and Vrn1b, respectively.

**Vrn-A1b** {10198}. v: Marquis PI94548 (GenBank AY616461){10198}. tv: *T. turgidum* var. durum ST36{10198}.

Complete deletion of the \textit{ZCCT1} gene \{10299\}.
**Vrn3**{1398}. Orthologous series in chromosomes of homoeologous group 1 predicted from orthology with **Vrn-H3**{Sh3} in barley chromosome 1H {1455,1316}. Aneuploid and whole chromosome substitution experiments showed that all group 1 chromosomes of wheat carry genes affecting response to vernalization {773}.

**Vrn-B3**{10421}. \[Vrn-4B{279}, Vrn5, eHi\{769,771,779\}. 7BS\{768,769,771\}. s: CS(Hope 7B) Vrn-D1a\{768\}. v2: Hope Vrn-A1a\{1424\}. ma: Vrn-B3 is completely linked to TaFT and 1 cM distal to Xabc158-7B on the region of 7BS proximal to the translocation with homoeologous group 5 \{10421\}. The dominant Vrn-B3 allele in Hope has a retrotransposon insertion in the TaFT promoter (GenBank DQ890165) \{10421\}. Transformation of winter wheat Jagger with the dominant Vrn-B3 significantly accelerated flowering \{10421\}. Different Hope seed sources were heterogeneous for this insertion \{10421\}. The retrotransposon insertion in the TaFT promoter is present in the CS (Hope 7B) \{10421\}.

**Vrn-H3**{10421}. \[Sh3\]. ma: Completely linked to HvFT and 1 cM distal to Xabc158 on 7HS. Originally mapped incorrectly on 1H based on loose linkage \{1455,1316\}.

**vn-B3. v:** Chinese Spring Vrn-D1 (GenBank DQ890162) \{10421\}. In both wheat and barley Vrn-3 is completely linked with a flowering promoter gene homologous to Arabidopsis FLOWERING LOCUS (FT) \{10421\}. Polymorphisms in the A and D genome copies of TaFT are associated with variation of earliness components in hexaploid wheat \{10533\}.

**Vrn4**{279}. \[Vrn5\{771,769\}, Vrn-D5\{10004\}\]. 5D\{10002\}.5DL\{10004\}. i: Triple Dirk F\{10711\}. s: CS (Hope 7B) VrnD1a\{768\}. v2: Gabo Vrn-B1a\{1172\}; IL47/Vrn-A1a\{10005\}. bin: Centromeric region. ma: Xgdm3-5D - 11.5 & 4.5 cM - Vrn4\{10004\}; Located in a 1.8 cM interval flanked by markers Xcfd78-5D and Xbarc205-5D \{10711\}. Eight land races with only Vrn4 were detected in \{10003\}; others combined Vrn4 with other Vrn genes. Stelmakh \{1424\} doubted the existence of Vrn4. Goncharov \{10108\} confirmed the existence of Vrn4 but failed to confirm its location on chromosome 5D. References to additional studies are given in \{1424\}.

**Vrn-D5a**\{10004\}. \[Vrn-D5\{10004\}, Vrn4\{1172\}\]. 5D\{10002\}.5DL\{10004\}. i: Triple Dirk F\{1172\}. v2: Gabo Vrn-B1a\{1172\}; IL47 Vrn-A1a\{10005\}. ma: Xgdm3-5D - 11.5 & 4.5 cM - Vrn-D5a\{10004\}. Eight landrances with only Vrn-D5a were detected in \{10003\}; others combined Vrn-D5a with other Vrn genes. Stelmakh \{1424\} doubted the existence of Vrn-D5a. Goncharov \{10108\} confirmed the existence of Vrn-D5a but failed to confirm its location on chromosome 5D. References to additional studies are given in \{1424\}.

**QTL:** Analysis in Courtot/CS \{0132\}. A QTL on chromosome 5BL was linked to Xgwm604-5B (this QTL explained 11% of the variance in flowering time) \{10075\}. Three genes up-regulated by vernalization were cloned from *T. monococcum* \{10531\}. These were VIN3-like genes similar to Arabidopsis VIN3.

**Vil-1**\{10531\}. GenBank DQ886919 \{10531\}. ma: *T. monococcum* chromosome 5A{5\{10531\}}.

**Vil-2**\{10531\}. GenBank DQ886917 \{10531\}. ma: *T. monococcum* chromosome 6A{6\{10531\}}.

**Vil-3**\{10531\}. GenBank DQ886918 \{10531\}. ma: *T. monococcum* chromosome 1A{1\{10531\}}.
Allelic variations at the Vrn-1 and Vrn-B3 loci in Chinese wheat cultivars are summarized in {10617}.

Aneuploid and whole chromosome substitution experiments showed that all group 1 chromosomes of wheat carry genes affecting response to vernalization {773}. Stem-elongation in winter wheat: In regions where wheat is used as a dual purpose crop for grazing and grain production a relatively long vegetative phase is required to maximize the vegetative tissue and to delay the stem elongation phase. Variation in this attribute occurs among winter wheats such as Jagger (early stem elongation) and 2174 (late elongation).

In a Jagger/2174 RIL population, QTL for stem elongation included Qste.0cs-5A (associated with the Vrn-A1 locus, Qste.ocs-1BL, Qste.ocs-2D (associated with the Ppd-D1 locus) and Qste.ocs-6A {1010}. In 2007 the respective $R^2$ values were 0.289, 0.155, 0.067 and 0.058. Jagger alleles on chromosome 5A, 1B and 6A promoted stem elongation whereas the allele on chromosome 2D had a delaying effect {10722}.

68. Restorers for Cytoplasmic Male Sterility

68.1. Restorers for T. timopheevi cytoplasm

$Rf1\{823\}$. 1A\{1224,1619,873\}.1AS\{868\}. v: L22\{868\}; (T. timopheevii/Aegilops squarrosa)\//3Dirk\{1619\}. v2: T. timopheevii/3 Marquis Rf2\{823\}; R113 Rf4\{873\}. The second gene referred to as $Rf4\{1619\}$ in the last stock was located in chromosome 7D, but its relationship to $Rf2$ in {823} is unknown.

$Rf2\{823\}$. 7D\{871\}. v: T. timopheevii/3 Marquis Rf1\{823\}.

$Rf3\{1453\}$. 1B\{1453\}.1BS. v: R18\{10222\}; R9034\{10222\}; T. spelta var. duhamelianum\{1453\}. ma: Xcdo388-1B - 1.2 cM - Xabc156-1B\{9934\}; RFLP markers Xcdo442-1B and Xbcd249-1B were found to be associated with $Rf3$ on 1BS\{860\}; Mapped as a QTL in the region Xbarc207-1BS - Xgwm131-1BL - Xbarc61-1BL in crosses R18/ND36 and R9034/ND36\{10222\}.

$Rf4\{1619\}$. 6B\{1619\}.1BS\{868\}. v: L3\{868\}; (T. timopheevii/Aegilops squarrosa)\//3Canthatch Rf5\{1619\}; R113 Rf1\{873\}.

$Rf5\{1619\}$. 6D\{1619\}. v: (T. timopheevii/Aegilops squarrosa)\//3Canthatch $Rf4\{1619\}$.

$Rf6\{865,859\}$. 6AS[T6AL.6AS-6U]\{865\}.6BS[T6BL.6BS-6U]\{865\}. tr: Line 2114\{865\}; Lines 040-5; 061-1\{865\}; 061-4\{865\}. Genes $Rfc3$ in chromosome 6RL and $Rfc4$ in chromosome 4RL were reported in {225}. Novel $Rf$ genes were identified on 5AL linked to Xcdo786-5A and XksuH1-5A\{860\}. Minor restorer effects were associated with Xbarc330-5A in R18 and Xgdml30-7D in R9034\{10222\}. The relationships of these QTL with previously located restorers in chromosomes 5A {860} and 7D (Rf2) are unknown.

68.2. Restorers for Aegilops longissima cytoplasm

$Vi\{867\}$. 1B\{870\}.1BS\{027\}. v: T. turgidum\{867\}.

Probably derived from a cv. Selkirk (T. aestivum) line with Ae. cylindrica cytoplasm {867}.

68.3. Restorers for photoperiod-sensitive Aegilops crassa cytoplasm

Morai & Tsunewaki {1047} described photoperiod sensitive CMS caused by Ae. crassa cytoplasm in wheat cv. Norin 26. Almost complete sterility occurred when plants were grown in photoperiods of 15h or longer.
A different system of restoration occurs in cv. Norin 61 where at least four chromosomes, 4A, 1D, 3D and 5D, appear to be involved \(1046\). Several Japanese wheats carry a similar or equally effective gene combination \(0335\).

69. Ribosomal RNA

The 5S-Rrna-1 loci were physically mapped in 1AS, 1BS, and 1DS and the 5S-Rrna-2 loci were physically mapped in 5AS, 5BS and 5DS of Chinese Spring using deletion lines \(1043\). Table 1 in \(276\) lists the chromosome or chromosome arm locations of rRNA loci in 12 Triticeae species.

69.1. 5S rRNA genes

Within the Triticeae there are basically two sets of 5S rRNA loci. One set, identified by repetitive units 320-468 bp in length, is located on group 1 chromosomes. The other set, identified by repetitive units 469-500 bp in length, is on group 5 chromosomes. Within species the repetitive units at a locus are extremely uniform in size and sequence. They remain stable in foreign genetic backgrounds.

73. Sterol Esterification in Kernels - Synthesis of b-Sitosterol Esters

Two sterol-ester phenotypes, *p-L* (palmitate + linoleate) and *L* (linoleate) are inherited as alleles at a single locus.

- **Pln** (428). [P-L (428)]. 7DS (1476). **v**: Aradi (428); Aragon 03 (428).
- **pln** (428). [L (428)]. **v**: Mara (428); Pane 247 (428).

74. Stem solidness

Solid stem, caused by increased pith in normally hollow stem regions, is associated with resistance to wheat stem sawfly, *Cephus cinctus*. Solid stem confers resistance to wheat stem sawfly. See also Reaction to *Cephus* spp.

- **Qsst.msub-3BL**. 3BL (10206). **v**: Rampart PI 59388 (10206). **ma**: Linked to microsatellite markers Xgwm247-3B, Xgwm340-3B, and Xgwm547-3B. These markers explained 76% of the total variation for stem solidness in Rampart/Jerry (10206).

Stem solidity in chromosome 3B of Golden Ball was verified in Langdon-Golden Ball disomic substitution lines (10730).
**Temperature-Sensitive Winter Variegation**

This phenotype involves reduced vigour and chlorotic patches on leaves of certain genotypes in *Ae. umbellulata* cytoplasm when grown at low temperatures [1596].

*Vgw*. Variegation is dominant [1596]. [Vg{1021}]. 5BL{1021}. v: Bersee{1596}; Cappelle-Desprez{1596}; Hobbit Sib{1596}; Mara{1596}. 

vgw{1021}. v: Besostaya I{1596}; CS{1596}; Poros{1596}; Sava{1596}; *T. spelta*{1596}.

**Tenacious Glumes**

*Tg1*{1240}. Derived from *Ae. tauschii*. Dominant. [Tg{1240}]. 2DS{1240}. bin: 2BS-3 1.00-0.84. v: Synthetic ABD wheats{652}. ma: Placed in a 12 cM interval between *Xwmc112-2D* and *Xbarc168-2D*{10497}.

*Tg2*{0046}. Derived from *T. dicoccoides* 2BS{0046}. v: TA 3419 = Tetra Canthatch / *Ae. tauschii* ssp. meyeri TA1599{10769}. ma: *Tg2* is associated with *Xrsq805(Embp)-2B* and *Xpsr899-2B*{0046}; *Xgwm261/Xwmc503-2D* - 2.3 cM - *Tg2* - 5.9 cM - *Xfba88/Xfbc400-2D*{10769}.

Tg2{0046}. Derived from *T. dicoccoides* 2BS{0046}. v: TA 3419 = Tetra Canthatch / *Ae. tauschii* ssp. meyeri TA1599{10769}. ma: *Tg2* is associated with *Xrsq805(Embp)-2B* and *Xpsr899-2B*{0046}; *Xgwm261/Xwmc503-2D* - 2.3 cM - *Tg2* - 5.9 cM - *Xfba88/Xfbc400-2D*{10769}.

Soft Glume locus is not an orthologue of Tenacious Glumes {10769}.

A QTL analysis of the relationship of glume tenacity (*Gt*) with threshability (*Ft*) and the size of the glume base scar (*Gba*) after glume detachment in two crosses, viz. the ITMI population and CS*/*CS (*Ae. tauschii* 2D), was undertaken {10497}. In the first cross *QFt.orst-2D.1* and *QGt.orst-2D.1* were closely associated with *Xgwm261-2D*, and *XFt.orst-2D.2* and *XGt.orst-2D* were associated with *Xgwm455-2D*, in the second population only the first pair along with *Xba.orst-2D* were detected; these appeared to correspond with *Tg1*{10497}.

**Tiller Inhibition**

*tin1*{1212}. Restricted tiller number is recessive{1212} [Tin{1212}]. 1AS{1212}. 1A{10193}. v: Israel Uniculm 494{1212}; Banks + tin{10193}; Oligoculm 390{10193}; Uniculm 492{10193}. ma: *Xpsp2999(Glu3)-1A* - 3.9 cM - tin1/Xgwm136-1A - 2.4 cM - *Xwhs179-1A*{10193}; the 350 bp allele of *Xgwm136-1A* was diagnostic of *tin1*{10193}.

*tin2*{1212}. Tiller-reducing effect of this allele was dominant {9909}. [Tin{9909}]. 2A{9909}. v: 88 F2 185{9909}.

A QTL of large effect on spike number per plant in a DH population of Fukuho-Komugi/Oligoculm mapping to the *Hg* - *Xpsp2999(Glu3)-1A* region {10218} probably corresponds to *Tin1*.

**Uniculm Stunt**
Stunting is favoured by a combination of long days and low night temperatures \cite{581}. Caused by duplicate recessive genes, \textit{us1} and \textit{us2}, located in chromosomes 4A and 5B, respectively \cite{200}.

Genotypes: Normal \textit{v: Us1 us2}: Alfa \cite{581}; Jaral \cite{581}.

Normal \textit{v: us1 Us2}: Mabruk \cite{581}.

Stunted \textit{v: us1 us2}: Line 492 \cite{581}.

79. Variegated Red Grain Colour

\textit{vg} \cite{498}. \textit{v:} Line 10859 \cite{498}.

\textit{vg vg} genotypes in Line 10859 are variegated. The \textit{Vg/vg} locus was independent of the single red gene locus in Line 10859. In a cross to Selkirk (\textit{R-Alb, R-B1b, R-D1b}) \textit{vg vg} was expressed only in plants with one \textit{R} gene \cite{498}. Variegated red pericarp was also studied in crosses of cv. Supreme. In this case, two red colour genes were present \cite{0136}.

80. Yield and Yield Components

80.1. Grain number per spike

\textit{QGnu.ipk-4A} \{0255\}. 4AL \{0255\}. \textit{v:} Opata/W-7984 (ITMI) RI mapping population \{0255\}; Higher grain number was contributed by Opata \{0255\}. \textit{ma:} Associated with \textit{Xmωg549A}, \textit{Xabg390A}, and \textit{Xbcd1670A} \{0255\}. \textit{QGnu.ipk-4A} coincides with QTL for height (\textit{QHt.ipk-4A}), spike length (\textit{XEl.ipk-4A}) and grain weight per ear (\textit{QGwe.ipk-4A}) \{0255\}.

\textit{QKps.unl-3A.1} \{10044\}. 3AS \{10044\}. \textit{v:} Cheyenne/Cheyenne (Wichita 3A) RI mapping population \{10044\}; a higher kernel number of 0.3 kernels was contributed by Wichita and the QTL explained 15.5\% of the phenotypic variation \{10044\}; The QTL coincided with QTLs for grain yield, kernel number per square metre and 1000-kernel weight \{10044\}. \textit{ma:} Associated with \textit{Xbarc12-3A} \{10044\}.

\textit{Qkps.unl-3A.2} \{10044\}. \textit{v:} Cheyenne/Cheyenne (Wichita 3A) RI mapping population \{10044\}; a higher kernel number of 0.3 kernels was contributed by Cheyenne and the QTL explained 9.5\% of the phenotypic variation \{10044\}. \textit{ma:} Associated with \textit{Xbcd141-3A} \{10044\}.

QTL: Three QTLs for kernel number per spike were assigned to chromosome 3A in RSLs from Cheyene’7/Wichita \{0025\}.

80.2. Grain volume weight

\textit{QGvwt.unl-3A.1} \{10044\}. 3A \{10044\}. \textit{v:} Cheyenne/Cheyenne (Wichita 3A) RI mapping population \{10044\}; higher grain volume weight (+23 kg/L) was contributed by Wichita and the QTL explained 43.1\% of the phenotypic variation \{10044\}; the QTL coincided with a QTL for spikes per square metre \{10044\}. \textit{ma:} Associated with \textit{Xbcd1380-3A} \{10044\}.

80.3. Grain weight

80.3.1. 50-grain weight

\textit{QFgw.ocs-4A.1} \{0047\}. 4A \{0047\}. \textit{v:} CS/CS(Kanto107 4A) mapping population \{0047\}. \textit{ma:} Associated with \textit{Xbcd265-4A} and \textit{Xbcd1738-4A} \{0047\}.

80.3.2. 1000-grain weight
QTL: Two QTLs for 1,000-kernel weight were assigned to chromosome 3A in RSLs from Cheyenne*7/Wichita 3A {0025}. QTLs for grain size were identified on chromosome arms 1DS, 2DL and 6BL in a RIL population from RS111/CS {0236}. Eight QTLs for 1,000-kernel weight (54 % of the variation) were mapped in Forno/ Oberkulmer spelt {0280}.

Based on the rice GIF1 gene encoding a cell wall invertase (GenBank accession EU095553), common wheat TaCwi-A1 was cloned, and two STS markers Cwi21 and Cwi22 were developed from the polymorphisms between two allelic variants. On average, TaCwi-A1a had 1,000 grain weights 2.4 g higher than TaCwi-A1b {10812}.

TaGW2-6A{10781}. ma: Xcfdl60-6AS.2 - 0.6 cM - TaGW2-CAPS - 0.5 cM - Xbarc146-6A.1/Xwms132.4-6A{10781}.
Based on its OsGW2 orthologue in rice this gene was characterized and mapped as a CAPS marker in wheat {10781}. SNPs in the promoter region allowed distinction of two haplotypes. Hap-6A-A was mainly present in southern Chinese wheats; Hap6A-G was present in varieties from central and eastern Europe. On average Hap-6A-A had 1,000 grain weights more than 3g higher than Hap-6A-G {10781}.

80.3.3. Test weight

QTwt.crc-1B{10287}. 1B{10287}. ma: Linked to Xgwm374.1-1B (LOD 4.3) in RL4452/AC Domain{10287}.

QTwt.crc-1D{10287}. 1D{10287}. ma: Linked to Xgdm126-1D (LOD 5.8) in RL4452/AC Domain{10287}.

QTwt.crc-2D{10287}. 2D{10287}. ma: Linked to Xgwm349-2D - Xbarc59-2D (LOD 5.2) in RL4452/AC Domain{10287}.

QTwt.crc-3B{10287}. 3B{10287}. ma: Linked to Xwmc625-3B - Xbarc164-3B (LOD 15.4) in RL4452/AC Domain{10287}.

QTwt.crc-3D{10287}. 3D{10287}. ma: Linked to Xbarc71-3D (LOD 5.2) in RL4452/AC Domain{10287}.

QTwt.crc-5D{10287}. 5D{10287}. ma: Linked to Xgdm63-5D - Xwmc765-5D (LOD 5.3) in RL4452/AC Domain{10287}.

80.4. Grain weight/ear
**MORPHOLOGICAL AND PHYSIOLOGICAL TRAITS**

**QGwe.ocs-4A.1**\{0047\}. 4AS\{0047\}. \textit{v}: CS/CS(Kanto107 4A) mapping population\{0047\}. \textit{ma}: Associated with \textit{Xbcd1738-4A} \{0047\}.

**QGwe.ipk-2D**\{0255\}. 2DS\{0255\}. \textit{v}: Opata/W-7984 (ITMI) RI mapping population\{0255\}; Higher grain weight was contributed by Opata\{0255\}. \textit{ma}: Associated with \textit{Xcdo1379-2D} and \textit{Xbcd1970-2D} \{0255\}.

**QGwe.ipk-4A**\{0255\}. 4AL\{0255\}. \textit{v}: Opata/W-7984 (ITMI) RI mapping population\{0255\}; Higher grain weight was contributed by Opata\{0255\}. \textit{ma}: Associated with \textit{Xmwd549-4A}, \textit{Xabg390-4A} and \textit{Xbcd1670-4A} \{0255\}.

**QGwe. ipk-4A** coincided with QTLs for height \textit{(QHt.ipk-4A)}, spike length \textit{(XEl.ipk-4A)} and grain number \textit{(QGnu.ipk-4A)} \{0255\}.

**80.5. Grain yield**

Non-glauous (viresent) lines from a Shamrock/Shango DH population had higher yields than glaucous sibs \{10543\}; see Glaucousness, subsection Epistatic inhibitors of glaucousness.

**QGyld.unl-3A.1**\{10044\}. 3AS\{10044\}. \textit{v}: Cheyenne/Cheyenne(Wichita 3A) RI mapping population\{10044\}; a higher grain yield of 32 kg/ha was contributed by Wichita and the QTL explained 6.6\% of the phenotypic variation\{10044\}; The QTL coincided with QTLs for kernel number per square metre, 1000-kernel weight and kernels per spike\{10044\}.

**QGyld.unl-3A.2**\{10044\}. 3A\{10044\}. \textit{v}: Cheyenne/Cheyenne (Wichita 3A) RI mapping population\{10044\}; a higher grain yield of 82 kg/ha was contributed by Wichita and the QTL explained 28.1\% of the phenotypic variation\{10044\}; The QTL coincided with a QTL for kernel number per square metre\{10044\}. \textit{ma}: Associated with \textit{Xbarc67-3A} and \textit{Xbcd366-3A} \{10044\}.

Grain yield under drought stress

QTL: Dharwar Dry (drought tolerant)/Sitta: SSR locus \textit{Xwmc89-4AL} was the marker most closely associated with QTL for grain yield, grain fill rate, spike density, grains/m², biomass and drought susceptibility index covering a genetic distance of 7.7 cM \{10488\}.

**80.6. Kernel number per square metre**

**QKpsm.unl-3A.1**\{10044\}. 3AS\{10044\}. \textit{v}: Cheyenne/Cheyenne(Wichita 3A) RI mapping population\{10044\}; higher kernel number (170 kernels) was contributed by Wichita and the QTL explained 14.6\% of the phenotypic variation\{10044\}; The QTL coincided with a QTL for grain yield\{10044\}. \textit{ma}: Associated with \textit{Xbarc12-3A} \{10044\}.

**QKpsm.unl-3A.2**\{10044\}. 3A\{10044\}. \textit{v}: Cheyenne/Cheyenne (Wichita 3A) RI mapping population\{10044\}. \textit{ma}: Associated with \textit{Xbarc67-3A} \{10044\}. 
80.7. Spikelet number/ear

\( Q_{Spn.ocs-4A.1} \) {0047}. 4AS{0047}. v: CS/CS(Kanto107 4A) mapping population{0047}. ma: Associated with Xbcd1738-4A{0047}.

80.8. Spike number per plant

\( Q_{Sn.sdau-BL} \) {10784}. ma: Xwmc657-4B - 4.6 cM - \( Q_{Sn.sdau-4B} \) - 1.6 cM - Xgwm495-4B {10784}. 
\( Q_{Sn.sdau-BL} \) was resolved as a single gene in Line 05210/Laizhou 953 {10784}. It was associated with decreased spike length and grain number per spike.

80.9. Spike number per square metre

QTL: A QTL for spike number per square metre was assigned to chromosome 3A in RSLs from Cheyenne’7/Wichita 3A {0025}.

80.10. Spike length

\( Q_{El.ipk-1B} \) {0255}. 1BL{0255}. v: Opata/W-7984 (ITMI) RI mapping population{0255}; Longer ear was contributed by Opata{0255}. ma: Associated with Xbcd388-1B and Xwg605-1B{0255}.

\( Q_{El.ipk-4A} \) {0255}. 4AL{0255}. v: Opata/W-7984 (ITMI) RI mapping population{0255}; Longer ear was contributed by Opata{0255}. ma: Associated with Xmwg549-4A, Xabg390-4A and Xbcd1670-4A{0255}.

This QTL is likely to be a pleiotropic effect of the gene underlying the height QTL, \( Q_{Ht.ipk-4A} \) {0255}.

\( Q_{El.ipk-5A} \) {0255}. 5AL{0255}. v: Opata/W-7984 (ITMI) RI mapping population{0255}; Longer ear was contributed by W-7984{0255}. ma: Associated with Xmwg522-5A{0255}.

QTL: Five QTLs for spike length were detected in Courtot/Chinese Spring{0114} but only one on chromosome arm 5AL was consistent for at least two years.

80.11. Tiller number/plant

\( QTn.ocs-4A.1 \) {0047}. 4AS{0047}. v: CS/CS(Kanto107 4A) mapping population{0047}. ma: Associated with Xpsr163-4A{0047}.

81. Yellow Berry Tolerance

QTL: A QTL for yellow berry tolerance, contributed by RS111, was associated with Xgwm190-5D and Xgwm174-5D in a RIL population from RS111/CS {0237}. A tolerance QTL contributed by CS, the susceptible parent, was detected on 6B {0237}.
82. Proteins

82.1. Grain protein content

Thirteen QTLs for grain protein content were identified in a RI population from the cross WL711 (low protein content) and PH132 (high grain content) \{10055\}. The QTLs that were identified using more than one method or in more than one environment are listed below. Also listed is a QTL that was identified in the mean over the four environments and was therefore deemed important \{10055\}.

**Gpc-B1a.** \[QGpc.ndsu-6Ba\{623\}\].

This allele, fixed in cultivated durum, is a non-functional frame-shift mutation \{10438\}. A similar non-functional allele, or a complete deletion of *Gpc-B1*, is fixed in hexaploid wheat \{10438\}.

**Gpc-B1b\{10296\}.** \[QGpc.ndsu-6Bb\{623,10071\}, Gpc-6B1\{10299\}\]. 6BS. **ma:** Mapped to a 0.3 cM interval flanked by *Xicw79-6B* and *Xicw71-6B* \{10229\}; *Xcdo365-6B* - 1.5 cM - *Gpc-B1* - 1.2 cM - *Xucw67-6B* \{10296\}; A high-throughput codominant marker, *Xuhw89-6B*, was then mapped less than 0.1 cM from *Gpc-B1* \{10297\}.

*Gpc-B1b*, the functional allele \{10438\} in *T. dicoccoides*, affects senescence and maturity in addition to grain protein content, accelerating senescence and maturity \{10298\}. *Gpc-B1* is a NAC transcription factor designated *Nam-B1* \{10438\}. A paralogous copy of this gene is present in homologous group 2 (Nam2).

**Pro1\{777\}.** 5DL\{777\}. **s:** CS\*6/Hope 5D\{777\}.

May be identical to *Vrn-D1*.

**Pro2\{777\}.** 5DS\{777\}. **s:** CS\*6/Hope 5D\{777\}.

**QGpc.ccsu-2B.1\{10055\}.** 2BL\{10055\}. **v:** WL711/PH132 RI mapping population \{10055\}; higher protein content was contributed by PH132 and the QTL explained 13.4% of the phenotypic variation \{10055\}. **ma:** Associated with *Xgwm1249-2B* \{10055\}.

**QGpc.ccsu-2D.1\{10055\}.** 2DL\{10055\}. **v:** WL711/PH132 RI mapping population \{10055\}; higher protein content was contributed by PH132 and the QTL explained 19% \{0015\} and 14% \{10055\} of the phenotypic variation. **ma:** Associated with *Xgwm1264-2D* \{10055\}.

**QGpc.ccsu-3D.1\{10055\}.** 3DS\{10055\}. **v:** WL711/PH132 RI mapping population \{10055\}; higher protein content was contributed by PH132 and the QTL explained 16.3% of the phenotypic variation \{10055\}. **ma:** Associated with *Xgwm456-3D* \{10055\}.

**QGpc.ccsu-3D.2\{10055\}.** 3DS\{10055\}. **v:** WL711/PH132 RI mapping population \{10055\}; higher protein content was contributed by PH132 and the QTL explained 14% of the phenotypic variation \{10055\}. **ma:** Associated with *Xgwm892-3D* \{10055\}.

**QGpc.ccsu-7A.1\{10055\}.** 7AS\{10055\}. **v:** WL711/PH132 RI mapping population \{10055\}; higher protein content was contributed by PH132 and the QTL explained 32.4% of the phenotypic variation \{10055\}. **ma:** Associated with *Xgwm1171-7A* \{10055\}.

**QGpc.ipk.7B\{10628\}.** **v:** F26-70\{10628\}; Closely associated with *Ppd-B2* \{10628\}. **su:** Favorit(F26-70 7B)\{10628\}.

See response to Photoperiod.

**QGpc.ndsu-5B.1\{10161\}.** 5B\{10161\}. **v:** LDN (DIC5B)/LDN, contributed by DIC5B\{10161\}. **ma:** Nearest marker, *Xgwm604-5B* \{10161\}.

**QGpc.ndsu-5B.2\{10161\}.** 5B\{10161\}. **v:** LDN (DIC5B)/LDN, contributed by DIC5B\{10161\}. **ma:** Nearest marker, *Xabc310-5B* \{10161\}.

**QGpc.ndsu-5B.3\{10161\}.** 5B\{10161\}. **v:** LDN (DIC5B)/LDN, contributed by DIC5B\{10161\}. **ma:** Nearest marker, *Xwg909-5B* \{10161\}.

Two types of nomenclature were assigned to the genes encoding the a-AMY-1 isozymes. In one, allelic states were defined for individual isozymes {1084} whereas in the other, several isozymes were considered to be the products of compound loci {007,412}. This listing shows the 'alleles' described in {1084} which are assumed in {007} to be synonymous with the a-Amy-B1a through a-Amy-B1h nomenclature. Amy 4 and Amy 4' are unmapped alternatives {1084} which appear to be identical to zymogram bands [bands 9 and 9b {007}] forming part of the a-Amy-B1 phenotype. Amy 6B1 [with forms Amy 6B1a, and Amy 6B1b, considered to be mutually exclusive {1084}] and Amy 6B2 [with forms Amy 62 and Amy 6B2'' {1084}] describe further aspects of a-Amy-B1 {007}. See a-Amy1 below for further consideration of Amy 6B2 {1084}.

Three other a-Amy loci, namely, Amy 6B2, Amy 6D2, and Amy 7B2, were reported {1084}. No variation was observed for the products of Amy 6D2 and Amy 7B2, although nullisomic analysis located the genes in 6DL and 7B, respectively. In accordance with the Guidelines, these genes are assumed to be part of the a-Amy-D1 and a-Amy-B2 loci, respectively. Amy 6B2 was observed to produce alternative phenotypes {1084}. In a test of the segregation of these phenotypes relative to two alternative products of Amy 6B1, the two loci were found to be linked with a recombination frequency of 20.6% {1084}. However, an attempt to confirm the presence of more than one a-Amy locus in 6BL was unsuccessful {007}.

Among 208 hexaploid accessions, an apparent Est-B2 null allele occurred frequently in accessions of *T. macha* and *T. sphaerococcum* and occasionally in accessions of *T. compactum*. The allele was not observed in *T. aestivum* and *T. spelta* accessions \{585\}.

82.2.7.3. EST-3

EST-3 is a monomeric enzyme that is expressed in young seedlings (this enzyme was not observed in \{814\}).

**Est-B3.** [Est-3\(_B\)\{585\}]. 7BS\{585\}. \(v:\) CS.

**Est-D3.** [Est-3\(_D\)\{585\}]. 7DS\{585\}. \(v:\) CS.

**Est-H3.** \{520\}. 7H\{520\}. \(ad:\) CS/Betzes.

One accession carrying an apparent Est-B3 null allele and one carrying an apparent Est-D3 null allele were found among 208 hexaploid accessions \{585\}.

A 7AS locus encodes three esterase isozymes in immature grains \{009\}.

82.2.7.4. EST-4

EST-4 is a monomeric, leaf-specific enzyme that electrofocuses around pH 4.5.

**Est-A4.** [Est-4\(_A\)\{585\}]. 6AL\{585,919\}. \(v:\) CS.

**Est-B4.** [Est-4\(_B\)\{585\}]. 6BL\{585,919\}. \(v:\) CS.

**Est-D4.** [Est-4\(_D\)\{585\}]. 6DL\{585,919\}. \(v:\) CS.

Probable Est-A4 and Est-D4 null alleles were detected in several accessions of *T. compactum* var. *rubriceps* \{585\}; otherwise, no Est-4 variant occurred among 208 hexaploid accessions \{585\}.

An esterase gene was located in chromosome L7 (= 6Ag\(^i\)) of *Th. intermedium* \{361\}.

82.2.7.5. EST-5

EST-5 consists of 20 or more monomeric, grain-specific isozymes that electrofocus between pH 5.6 and 7.0.

**Est-A5.** \{009\}. 3AL\{009\}. \(v:\) CS.

**Est-A5a.** \{009\}. \(v:\) CS.

**Est-A5b.** \{009\}. \(v:\) Kalyansona\{009\}; *T. compactum* AUS12084\{756\}.

**Est-B5.** \{009\}. 3BL\{009\}. \(v:\) CS.

**Est-B5a.** \{009\}. \(v:\) CS.

**Est-B5b.** \{009\}. \(v:\) Big Club.

**Est-B5c.** \{009\}. \(v:\) Timstein.

**Est-B5d.** \{009\}. \(v:\) Sears’ Synthetic.

**Est-D5.** \{009\}. 3DL\{009\}. \(v:\) CS.
Encoding of the endosperm esterases of hexaploid wheat by 12-15 genes in five compound loci located in 3AL, 3BL, 3DL, 3AS and 3DS was postulated in {1204}. Three and six alleles at Est-D5 (in Ae. tauschii) were reported in {756} and {1578}, respectively.

In S. cereale, in addition to Est-R1, genes encoding leaf esterases were located in three chromosomes {1561}. These included a gene designated Est8 in 6R in cvs. Imperial and King II, a gene designated Est6 and Est7, which are part of a separate compound locus {1560}, in 5RL in Imperial, and a gene designated Est10 in 4R of King II and 4RL of Imperial. In Hordeum vulgare, genes encoding leaf esterases were located in 3H {1071; see also, 520,580} and 7H {520}.

A second S. cereale gene encoding grain esterases, designated EstB, was located in 4RL in King II and Petkus and in 7RS in Imperial {737}.

Sixty Ae. tauschii lines revealed six Est-D5 alleles {1578}.

82.2.7.6. EST-6

EST-6 is a dimeric enzyme that electrofocuses around pH 7.6 and is specific to endosperm.

A group of leaf esterase isozymes controlled by the long arms of the homoeologous group 3 chromosomes were reported {919}. The relationship of these esterases to EST-2 and to the leaf esterase designed EST-6 reported in {629} has not been determined.

82.2.7.7. EST-7

EST-7 is a monomeric enzyme that electrofocuses in the same region as EST-6 but is specific to green tissues.
PRoTEINs

82.2.7.8. EST-8

EST-8 consists of about 10 isozymes that electrofocus between pH 4.5 and 6.5 and are expressed only in vegetative tissues. EST-8 is likely to be the enzyme previously described in {919} and {629}.

82.2.7.9. EST-9

EST-9 is a monomeric enzyme that electrofocuses around pH 5.0 and is expressed only in embryos.

82.2.8. Glucosephosphate isomerase

82.2.11. Lipoxygenase

The wheat Lpx-1 gene in wheat corresponds to barley LoxA (GenBank L35931). The Lpx-Bl locus is duplicated, with the Lpx-B1.1 and Lpx-B1.2 loci corresponding to GenBank sequences DQ474240 and DQ474241, respectively. The Lpx-B1b allele corresponds to a deletion associated with a 4.5-fold reduction in lipoxygenase activity. The Lpx-2 gene in wheat corresponds to the barley LoxC gene (GenBank L37358) whereas the Lpx-3 gene in wheat corresponds to the barley LoxB gene (GenBank L37359).

82.2.30. Starch branching enzyme II

\( \text{SbeII} \).

Suppression of SBEIIb expression alone had no effect on amylose contents, however, suppression of both SBEIIa and SBEIIb expression resulted in wheat starch containing >70% amylose \{10534\}.

82.2.31. Benzoaxinones

The putative role of benzoaxinones sets \( \text{Bx-1} \) to \( \text{Bx-5} \) is to catalyze the pathway Indole-3-glycerol phosphate to DIBOA. Primers designated from maize sequences were used to generate RT-PCR products utilised to screen a cDNA library from CS seedlings. Full-length cDNAs were heterologously expressed in yeast and the \( \text{Bx} \) gene products had enzymatic action. The \( \text{Bx} \) genes located by Southern analysis of CS deletion stocks occurred as clustered groups in homoeologous groups 4 (\( \text{Bx-1, Bx-2} \)) and 5 (\( \text{Bx-3.1, 2, Bx-4, Bx-5} \) \{10103\}).

82.2.32. Acetohydroxyacid synthase (EC 4.1.3.18)

An orthologous series was mapped as the active target sites of imidazolinone herbicides. See section: Herbicide Response: Imidazolinone resistance.
\( \text{AhasL-A1}\{10101\} \). \( [\text{Imi3}\{10099\}] \). \( 6\text{AL}\{10101\} \). \( v2: \text{CDC Teal IMI 15A} \text{ Imi3}\{10099\} \).

82.2.33. Phytoene synthase
Phytoene synthase, which condenses two molecules of geranyl geranyl diphosphate to produce phytoene, is the first of the specific enzyme necessary for carotene biosynthesis in plants.

82.2.33.1. Phytoene synthase 1 (EC 2.5.1.32)
Homology with the same gene in rice (Psy1) {10230}.
Phytoene synthase is involved in the carotenoid biosynthetic pathway and influences yellow pigment content in grain (See Flour colour and Grain quality parameters: Flour, semolina and pasta colour). The gene Psy-A1 was cloned and a functional marker developed from the sequence distinguishing Chinese common wheats with high and low pigment contents {10501}. Most hexaploid wheat cultivars have a 676-bp insertion in intron four that is absent in Australian cultivars Dundee, Raven, and Araona with high yellow pigment. The Psy-B1b allele from tetraploid wheat Kofa is the result of a B-A intergenomic conversion event that probably occurred in Cappelli ph1c mutant 1 {10530}. An EMS mutation in the Psy-E1 gene is associated with whiter endosperm in lines carrying the Th. elongatum 7EL translocation.

82.2.33.2. Phytoene synthase 2 (EC 2.5.1.32)
82.2.34. Polyphenol oxidase

High PPO activity in kernels and flour leads to a time-dependent discolouration of end products such as noodles, pasta and breads.

Primers different from those in \{10386\} were developed in \{10504\}, but their ability to distinguish phenotypic groupings (alleles) were similar. A null allele of \(Ppo-D1\) was identified for this locus using primer pair WP3-2 \{10504\}.

\(Ppo-A1\) \{10386\}. \(PPO-2A\) \{10385\}. \(2AL\) \{10385\}. \(ma\): Detected with STS markers PPO18 \{10385\}; and PPO33 \{10386\}; \(Xgwm321\) \(-2A\) \(-1.4\ cM\) \(-Ppo-A1\) \(-5.8\ cM\) \(-Xgwm294\) \{10385\}.

82.3. Endosperm storage proteins

82.3.1. Glutenins
These are heterogeneous mixtures of proteins comprising subunits linked by disulfide bonds. 'A' are high-molecular-weight (HMW) and 'B', 'C' and 'D' are low-molecular-weight (LMW) subunits.

Using proteomic analysis of 2D gels of seed storage proteins in 39 ditelocentric lines of cv. CS, 105 protein spots were resolved {03129}. Locations of structural genes controlling 26 spots were identified in 10 chromosomal arms (4 on 1BL, 5 on 1BS, 4 on 1DL, 4 on 1DS, 2 on 6AS, 3 on 6BS, 1 on 6DL, 1 on 6DS, 1 on 3BS and 1 on 3BL). Multiple regulators of the same protein located on various chromosome arms were observed. Two novel subunits, named 1Bz and 1Dz, were found to have very similar structures to HMW glutenin subunit 12 (encoded by Glu-D1-2a - see the relevant list below) and were located to chromosome arms 1BL and 1DL, respectively.

82.3.1.1. Glu-1
The Glu-1 loci, all of which are compound, encode HMW glutenin subunits. Each Glu-1 locus in hexaploid wheat contains two genes, the products of which were described as 'x-type' and 'y-type' based on differences in molecular weight and isoelectric point {1118}.

Other evidence has shown that these gene products differ in electrophoretic fingerprint pattern {1124} and cysteine content {1028}, and the genes themselves differ in nucleotide sequence {1470,1433,373}.

Although early evidence suggested up to 6 genes in total at each locus {1471,373}, it appears likely that only a single copy of each gene is present at the 1AL, 1BL, and 1DL loci {495}.

No 'y-type' protein from the Glu-A1 locus has been demonstrated in hexaploid wheat {1118}, although they are found in diploid wheats {1535,798}, and sequencing experiments have shown the presence of two stop codons in the transcribed portion of the gene {10088}. Definitive evidence that subunit 21* {602}, which has a mobility close to that of subunit 21, is a 'x-type' protein rather than a 'y-type' protein has not been obtained. The gene coding for 'x-type' proteins within Glu-A1 is also often silent {1118,420}.

The symbols for the genes within the Glu-1 loci coding for 'x-type' and 'y-type' proteins will be Glu-I-1 and Glu-I-2, respectively, rather than Glu-Ix and Glu-Iy {1470}. The genes are closely linked but recombination has been observed between Glu-B1-1 and Glu-B1-2 with a frequency of 3 in 3,450 {1117}. The gene order, relative to the centromere, has not been
ascertained.
The subunit nomenclature used is that devised in \{1116\}; however, an alternative system based upon molecular weight was proposed in \{1068\}. A system of naming the Glu-1-1, Glu-1-2, Glu-B1-1 and Glu-B1-2 alleles in \textit{T. turgidum} var. \textit{dicoccoides} is given in \{796\}.

In \{00116\}, a comparison between spelt wheats (\textit{T. spelta}) and bread wheat was carried out for the glutenins using a nomenclature system described in \{00117\}. The Glu-1 loci may be recognised by the DNA probe pTag1290 \{1471\} and probe pwh1(Dy10) \{030\}. Individual Glu-1-I loci on 1A, 1B and 1D and the Glu-I-2 loci may be recognised by specific primers \{263\}.

In \{00105\}, the evolution of the high molecular weight glutenin loci of the A, B, D and G genomes of wheat was explored; 30 partial allele sequences were compared, designated by Greek letters (alpha, beta, gamma, etc.) (5 of which were cited as Schlumbaum, pers. comm.; the remaining 25 were deposited as GenBank, accession nos. X98583-X98592, X98711-X98715 and Y12401-Y12410). These partial alleles derive from all six Glu-1-I and Glu-1-2 loci in current-day samples taken from seven species of wheat, as well as from DNA extracted from charred grain of two samples from archaeological excavations, dated 3000 and 5000 years old, respectively.

Following the first listing which considers the Glu-1 set for hexaploid wheat as a single locus, there is a provisional listing based on x- and y-type glutenins. These are not referenced.

The importance of the HMW glutenin subunits for bread-making quality was first noted from observations in wheat cultivars of related pedigree on the effects of the presence of subunit 1 encoded by Glu-A1a \{0197\}, effects that have repeatedly been confirmed since (for example \{0198,0199,01100\}).

A nomenclature system for prolamin banding patterns of triticale was proposed in \{03139\}. Extensive allelic variation in triticale at Glu-A1, Glu-B1, Glu-R1 and Gli-R2 loci was reported in \{03121\}.

The allele designated Glu-A1u and Glu-A1-1u in the appropriate list below encodes a high molecular weight glutenin subunit (denominated 2*B) that is identical to subunit 2* apart from one amino acid difference involving the exchange of serine for cysteine (which itself is due to a C to G point mutation at the 1181 bp point of the coding region of 2*). The authors of {02106} suggest that the additional cysteine residue facilitates the formation of further disulphide bonds (cf. the 1Dx5 subunit) which might lead to an improvement in gluten quality characters.

There is a possibility that Glu-A1 alleles i, j {1527} and k {478} correspond to alleles d, e, f or g {1535} that were published shortly earlier. Glu-A1m {1526} was changed to n, because the m allele in {1069} has precedence. Allele n {1526} was changed to o. An earlier reference to an allele designated Glu-A1d {1411} was withdrawn {1114}. There appears to be a minor band associated with subunit 2 encoded by Glu-A1b {1516}; this may be the same as a band named A5 in {420}. Six combinations involving 5 HMW subunits [1A (u-z)] are listed in {420}, from a study of 109 genotypes including representatives of botanical varieties. A number of alleles in T. turgidum var. dicoccoides populations, 12 at Glu-A1-1 and 3 at Glu-A1-2, were described in {798}. In a further study using different germplasm of this species {205}, 14 alleles at Glu-A1 were observed, including 12 not previously found; the 15 alleles included up to 15 alleles at Glu-A1-1 (with up to 10 not previously observed), and 5 alleles at Glu-A1-2 (with 4 not previously observed) (numbers take the null allele into account). The uncertainty in numbers is due to the very similar electrophoretic mobilities of some of the subunits compared with others observed either in this study or previously. In a study including emmers (T. dicoccum) {00115}, new subunits named 1+ and 2- were found in accessions MG4378/1 and MG5380/1, respectively, and provisionally assigned to Glu-A1. Until confirmed, they are not included in the Glu-A1 list.

Glu-B1ah {782}. null allele {782}. v: Olympic mutant.
Glu-B1ai {714}. 7’ {714}. v: Adonis.
Glu-B1aj {759}. 8 {759}. v: AUS 14444, Afghanistan.
Glu-B1ak {899}. 7*+8* {899}. v: Norstar.
Glu-B1al {899}. 7OE+7OE+8* {899}. v: Benkuti 1201 {10196, 10197}; Glenlea {899}; Klein Universal II {10196}; Tezanos Pintos Precoz {10196}; Tobari 66 {10196}.

Other genotypes are listed in {10196}.

Many of the cultivars carrying the over-expressed subunit 7 encoded by Glu-B1al show %UPP values that transcend the normal range observed for cultivars that lack this subunit {10089}, which presumably is associated in some way with its unusually high amount in the grain. The underlying cause of the increased amount may be due to an increased transcriptional rate compared to other alleles, for which a known difference in promoter sequence compared to other alleles expressing normal levels of this subunit {10090} may be responsible.

However, there is evidence that over-expression is due to duplication of subunit 7 {10196}. In regard to subunit 8’, evidence was presented to indicate that in Glenlea, one of the standard cultivars for the allele, this subunit is the same as subunit 8 {10808}.

The alleles formerly designated \( t \) to \( x \) in {959} were renamed \( x \) to \( ab \) because allele \( t \) in {847} and alleles \( u, v \) and \( w \) in {1069} had precedence. Subunit 8 of \( Glu-B1b \) (7+8) is more acidic in isoelectric focusing than subunit 8 of \( Glu-B1d \) (6+8) {555}. Variation in the mobility of subunits designated 7 has been observed {1118}, which accords with more recent observations {714,1069}. The subunit encoded by \( Glu-B1v \) {1069} has the same mobility as subunit 7 of \( Glu-B1c \) (7+9); it could be the same subunit as 7' encoded by \( Glu-B1l \) {714}.

Variation in the staining intensity of subunit 7 in different lines was observed {1069}; a duplication of the gene encoding subunit 7 probably occurred in cultivar ‘Red River 68’, as evidenced by increased intensity of the subunit in SDS-PAGE and by approximately doubled intensity of restriction fragments carrying the gene in Southern blotting {9989}. Possible low gene expression at \( Glu-B1 \) was noted for \( Glu-B1w \), where subunits 6*+8* stain very faintly {1146}.

One of the \( Glu-B1af \) subunits was numbered 26 in {1146}; 26 was previously used to number the subunit encoded by \( Glu-A1k \) {478}. Subunit 28 of \( Glu-B1ag \) (28+29) {1146} is referred to as subunit 19* in {1068}. Subunit 23 of \( Glu-B1p \) {23+18} and \( Glu-B1ad \) (23+22) {125} may not be the same subunit as that numbered 23 of \( Glu-B1l \) {23+24} {778}. \( Glu-B1z \) carried by Roccia was numbered (7+15) and named \( Glu-B1-XII \) in {125}; however, the earlier name, \( Glu-B1-IX \) {1523}, has precedence; also, {1523} states that the \( Glu-B1-IX \) subunit of faster mobility is slightly slower than subunit 15. Subunit 11 of \( Glu-B1s \) {7+11} was so numbered in {478} because its mobility is the same as one of the subunits encoded by a \( Glu-D1 \) allele (2+11) described in {755}. Eight alleles at \( Glu-B1-1 \) and 10 alleles at \( Glu-B1-2 \) in \( T. turgidum \) var. \( dicoccoides \) populations were described in {798}. In a further study using different germplasm of this species {205}, 19 alleles at \( Glu-B1 \) were observed, including 15 not previously observed; the 19 alleles included 11 alleles at \( Glu-B1-1 \) and 14 alleles (including the null allele) at \( Glu-B1-2 \), although, as the authors pointed out, it was not conclusively clear how many of these alleles were distinct from each other, or from others previously observed.

In a study including emmer wheats (\( T. dicoccon \)) {00115}, new subunits named 7* in accessions MG5400/5 and MG30835/1, 8* in accessions MG5400/5, MG30835/1, MG5333/1 and MG5507 and 13* in accession MG5282/2 were found and provisionally assigned to \( Glu-B1 \). Until confirmed, they are not included in the \( Glu-B1 \) list.

Although alleles \( Glu-B1i \) encoding subunits 17+18, and \( Glu-B1bc \) encoding subunit 6+17, apparently share a common subunit (Ax17 and By17, respectively) it is not clear that this is in fact true.

Primers were designed to distinguish subunit By8 from By8*, for distinguishing subunit By9-containing alleles from non-By9 alleles, and for diagnosing the presence of \( Glu-B1f \).

This putative new allele encodes two subunits that have very similar electrophoretic mobilities compared to subunits 5+12 encoded by Glu-D1h, but analysis using the specific PCR primers for Dx5 described in [10092] and [10093] shows that the x-type subunit of Glu-D1bo, provisionally denominated 5' [10091], does not appear to be the same protein as subunit 5 [10091]. Definitive evidence awaits sequencing information (see note to allele Glu-D1-1s).

Glu-D1k [421] appears to have arisen as the result of a deficiency of subunit 12 from Glu-D1a (2+12); subunits 2 and 12 are referred to as D1 and D5 in [421]. One of the Glu-D1o subunits has been numbered 13 in [755]; 13 was previously used to number a subunit encoded by Glu-B1f (13+16) and Glu-B1g (13+19) [1116]. Subunit 9 of Glu-D1g (5+9) was so numbered in [478] because its mobility is the same as one of the subunits encoded by Glu-B1c (7+9).
The complete sequence of this subunit was determined \{10319\}.

Subunit 10.1t possesses a mobility slightly lower than subunit 10 in SDS-PAGE and its deduced amino acid sequence is similar to subunit 12 (8 amino acid differences) \{10426\}; the authors used the complete coding sequence to make phylogenetic comparisons with 19 other subunits including both x-type and y-type subunits and concluded that \textit{Glu-1} gene duplication event probably occurred about 16.83 million years ago.

Five combinations involving 6 HMW subunits [1D (p-t)] are listed in \{420\}. Eleven additional \textit{Glu-D1} alleles in \textit{T. tauschii} were described \{755\}.

Seven transfers of \textit{Glu-D1a} and 10 of \textit{Glu-D1d} (5+10) from chromosome 1D to chromosome 1A in triticale were described \{846\}.

The subunit 2.2* encoded by \textit{Glu-D1al} and \textit{Glu-D1-1m} in the appropriate list below has an unusually high Mr. Comparison of its N-terminal sequence and amino acid composition with those of subunit 2 (encoded by \textit{Glu-D1-1a}) indicated that its greater Mr, could be due to the presence of a larger central repetitive domain, although further evidence suggested that this does not affect the conformational properties of the subunit \{02107\}.

The alleles originally designated \textit{Glu-D1w} (encoding 'subunits' 2 (or 2\textsuperscript{t} denoting its origin in the \textit{Ae. tauschii} genome) +T1+T2), \textit{Glu-D1af} (encoding 3 (or 3\textsuperscript{t})+T1+T2) and \textit{Glu-D1ag} (encoding 1.5 (or 1.5\textsuperscript{t})+T1+T2) share the component T1 that was originally classified as a HMW glutenin. However, it has since been shown \{02108\} that this protein is soluble in aqueous ethanol, casting doubt upon this classification. More recently, it was shown \{02109\}, from one and two dimensional gel electrophoresis based upon SDS-PAGE and A-PAGE, and from N-terminal sequencing, that this protein is an omega-gliadin of unusually low electrophoretic mobility in SDS-PAGE, encoded by a locus located on the short arm of chromosome 1D, though distant (13.18 cM) from the principle gliadin-encoding locus on 1D, \textit{Gli-D1}, and 40.20 cM from the high molecular weight encoding locus, \textit{Glu-D1}. The authors named the locus \textit{Gli-DT1} (see Gliadins). Reference to T1 was consequently removed from the \textit{Glu-D1} list. As a consequence of this finding, allele \textit{Glu-D1w} was reused for a distinct allele, and \textit{Glu-D1af} was omitted and will be reused for a future allele, since the combinations of subunits that these alleles originally represented are no longer unique.

In \{03124\}, null alleles were observed for both \textit{Glu-D1-1} and \textit{Glu-D1-2}, which, naturally, are not necessarily the same as those previously reported for this locus, meaning that composite alleles involving them in this study and corresponding to combinations apparently already listed in the Catalogue, may, in fact, represent novel alleles. It is also found that certain subunits of apparently identical relative mobility in SDS-PAGE showed different surface hydrophobocities in RP-HPLC; and the reverse situation was also observed (the same hydrophobicity, but different electrophoretic mobilities).

It was shown \{03126\} that the relatively small size of a y-type HMW glutenin subunit, named 12.4\textsuperscript{t} (encoded by \textit{Glu-D1-1t} \{03124\} - see below) and carried by accession CPI110750 of \textit{Ae. tauschii}, is due to the deletion of blocks of repetitive motifs, amounting to approximately 200 amino acids, probably caused by unequal crossing-over.

HMW glutenin y-type subunit Ee1.5 encoded by this locus was sequenced {10439} and compared with other y-type subunits, particularly subunit 1Dy10. It has major deletions in its middle region and is one of the smallest known HMW glutenin subunits. It has an additional Cys residue in the middle of the repetitive domain, but lacks one Cys residue commonly found towards the end of this domain. These changes may influence inter- or intra-molecular disulphide bond formation.

Four {10660, 10661} and 11 {10662} alleles were observed in *Agropyron elongatum* (E^5 genome, 2n = 10X = 70) and named Aex1 to Aex5 (producing x-type subunits) and Aey1 to Aey10 (producing y-type subunits). Aex4, Aey7 and Aey9 were very similar to three alleles in the diploid progenitor *Lophopyrum elongatum* {10439, 10663}. The C-terminal regions of three of the y-type subunits (products of Aey8, Aey9 and Aey10) were more similar to x-type subunits than to other y-type subunits {10662}. The subunit from Aex4 contained an additional cysteine residue, which may be associated with good processing quality in wheat introgression lines {10662}. Allele Aey-4 was a chimeric gene formed by recombination of two other genes {10662}.

There is a difficulty in the assignment of subunit 6r in the _Glu-R1-1_ and _Glu-R1-2_ lists, since it appears as an x-type subunit in allele _Glu-R1c_ and as a y-type subunit in allele _Glu-R1e_. It is currently provisionally assigned to the _Glu-R1-1_ list since, based upon its relative electrophoretic mobility, it is considered more likely to be an x-type subunit. Some of the remaining designations should also be considered as provisional since they too are not free of ambiguity.

From study of chromosome substitutions in bread wheat {03117}, it was found that a chromosome 1R carrying HMW secalin subunit 6.5r (_Glu-R1e_), originally derived from the 'Petkus' rye population, was associated with bread making quality (i) intermediate between chromosome 1A carrying the null allele _Glu-A1c_ and chromosome 1A carrying HMW glutenin subunit 2* encoded by _Glu-A1b_; (ii) equivalent to a chromosome carrying HMW glutenin subunit 7 encoded by _Glu-B1a_; and (iii) inferior to chromosomes 1D with distinct alleles.

Five new x-type subunits (plus the null allele) and four y-type subunits were reported in {10094}. They vary principally through duplications and deletions of the tri-, hexa- and nona-peptide motifs found in the central repetitive region of the subunits. Orthologous genes were found to be more closely related than paralogous genes, supporting the hypothesis that gene duplication occurred before Triticeae speciation {10095, 10094}.

Alleles and subunits at Glu-V1-1 and GLU-V1-2: The following is analogous to the Glu-1-1 and Glu-1-2 lists given earlier to identify x-type and y-type subunits in wheat. It was assumed that where an allele at Glu-V1 produces only a single subunit, it is an x-type subunit and so encoded by Glu-V1-1 rather than by Glu-V1-2; the electrophoretic mobilities of the subunits are all greater, though some only marginally so, than subunit 7 encoded by Glu-B1-1a (an x-type subunit), and extend beyond the mobility of subunit 12 encoded by Glu-D1-2a (a y-type subunit) \{1651\}; therefore, it is quite possible that any one of the subunits designated as encoded by Glu-V1-1 is, in fact, encoded by Glu-V1-2. The designation given here is intended to be the most practically useful until the identities of the genes encoding the alleles are directly established.

A Chinese cultivar of *T. aestivum*, Xiaoyanmai 7, carries a subunit with electrophoretic mobility in 10% SDS-PAGE well beyond that of subunits so far observed in *T. aestivum*. It may derive from *Agropyron elongatum*, which was used in the breeding programme that led to the variety \{1538\}. It has not been given a subunit number or allelic designation, because its genetic control has not been elucidated.

Glu-Ta1 \{10449\}. al: *Taenitherum crinitum* PI 204577 \{10449\}.

82.3.1.3. Glu-3

The Glu-3 loci are defined as the cluster of LMW glutenin genes previously considered a component of the compound Gli-1 loci.

More than 30 LMW glutenin complete genes, partial genes or pseudogenes have been sequenced from *Triticum* species (reviewed in \{0245\}).

In *T. aestivum*, only Glu-B3 was shown to recombine with the gliadin genes \{1355,1358\}. However, in *T. durum*, recombination was observed for both Glu-A3 and Glu-B3 with their respective Gli-1 loci: the map distance between Glu-A3 and Gli-A1 has been estimated as 1.3 +/- 0.4 cM \{1242\}, and that between Glu-B3 and Gli-B1 as 2.0 +/- 0.8 in \{1144\} and as 2.0 +/- 0.4 in \{1242\}. It appears that Glu-B3 is proximal to Gli-B1, and there is some evidence, albeit only tentative as the authors acknowledge, that Glu-A3 is proximal to Gli-A1 \{1242\}.

Whereas hitherto it has been widely thought that all the LMW subunits of glutenin were encoded by genes located on the chromosomes of homoeologous group 1, it has been
demonstrated that, although the majority of the subunits are indeed controlled by genes on this group, some of the C subunits must be controlled by loci elsewhere in the genome \( \{482\} \). A novel type of polymeric protein (Mr approx. 71,000) was reported in the Australian advanced breeding line DD118 \( \{03125\} \). It participates in the polymeric structure of glutenin (possibly as a chain terminator), and with an Mr of approximately 71,000, could be considered as a D-subunit of LMW glutenin. However, N-terminal sequencing suggests it to be a Gli-B1 type omega-gliadin that has acquired a cysteine residue through mutation.

In an electrophoretic survey of 51 primary tritordeums \( \{03113\} \), 20 distinct whole banding patterns (a-t), each consisting of between one and three bands, were observed for D-zone prolamins exhibiting glutenin-like solubility characteristics.

In 85 Japanese common wheat cultivars and 61 elite F\(_6\) breeding lines, 3 alleles were observed at each of Glu-A3 and Glu-B3, and 2 alleles at Glu-D3 were named according to their parental origins in three doubled haploid mapping populations \( \{03135\} \).

C-type LMW glutenin subunits in CS were assigned to chromosome groups 1 and 6, and shown to have sequences very similar to those of alpha- and gamma-gliadins \( \{03134\} \). The authors suggest that they may be encoded by novel genes at loci tightly linked or present within the Gli-1 and Gli-2 loci, unlike other LMW glutenin subunits encoded by the Glu-3 loci.

The HMW and LMW glutenin subunits carried by chromosome 1A\(^{10}\) of \( T. \) monococcum accession G1777 were characterised electrophoretically and evaluated for quality characteristics using recombinant chromosome substitution lines with chromosome 1A of CS \( \{03142\} \). The HMW subunits from G1777 are promising for bread-making quality, whereas its LMW subunits are promising for biscuit-making quality.

The bread wheat cv. Salmone has been shown to carry two DNA fragments designated as SF720 and SF750 located on the chromosome 1B satellite and associated with the presence of two LMW glutenin subunits \( \{03143\} \). However, the authors suggest that they occur at a locus other than Glu-B3 due to their relatively high frequency of recombination with Gli-B3.

A naming system in which roman numerals are assigned to whole banding patterns for the LMW glutenin subunit is given in \( \{03131\} \) as an alternative to the LMW-1/-2 system described in \( \{03136\} \). A further system naming whole banding patterns from LMW-1 to LMW-23 in emmer wheat is described in \( \{03137\} \).

In \( \{00111\} \), in a study of common and durum wheats from Portugal, the authors used the nomenclature system described in \( \{00113\} \) for the LMW subunits in common wheat, and that described in \( \{00114\} \) for the LMW subunits in durum wheat. The latter system was updated according to \( \{02110\} \), but has been changed herein to new alleles with the earlier durum designation \( \{00114\} \) given as synonyms. In \( \{03116\} \), it was suggested that Glu-B3d (common wheat standard genetic stock) is equivalent to Glu-B3r (durum wheat standard genetic stock), and that (referring to article \( \{03127\} \)) LMW subunits observed in some Portuguese triticales could be of the durum type.

A novel storage protein gene with chimerical structure was isolated from the old Hungarian cultivar Bankuti 1201, containing gamma-gliadin sequences in the 5' region, LMW-glutenin sequences in the 3' region and a frameshift mutation leading to a completely new polypeptide in the C-terminal region. A further seven recombinant prolamin genes were subsequently isolated. The eight genes, designated Ch\(_1\) to Ch\(_8\), seem to derive from four gamma-gliadin and three LMW-glutenin sequences and are probably the result of crossing over between the
loci Gli-1 and Gli-3. However, the precise recombinational mechanism that gave rise to them has yet to be elucidated{10307}.

The designation of this protein (subunit 6.1) as an allele of Glu-A3 was deduced from its electrophoretic mobility and awaits confirmation through mapping studies.

Three different approaches were employed to identify putative SNPs used to design gene-specific primers for LMW-GS genes, and six functional STS markers, three for Glu-B3 and three for Glu-D3. These markers distinguished cultivars with different haplotypes at the Glu-B3 and Glu-D3 loci, but there was no clear correlation between the alleles of
cultivars defined by protein electrophoretic mobility and the separation patterns of the DNA
markers, since all three Glu-3 loci were multiple gene loci and each protein electrophoretic
mobility allele was controlled by 3-6 coding genes {10665}.

A series of papers {00106, 00107, 00108 and 00109} describe considerable variation in
primitive wheats not present in bread wheat (A genome species T. boeoticum, T. urartu, T.
thaoudar, T. aegilopoides, T. monococcum, and D-genome species T. tauschii) for the low
molecular weight subunits, sufficient to use them as a source for potentially changing flour
properties in bread wheat.
In {00110}, variants for LMW glutenin subunits were reported from study of twenty-four
accessions of einkorn wheat (T. monococcum ssp. monococcum). Nine of these showed two
electrophoretic bands for LMW subunits, arbitrarily designated 'a' and 'b', that appeared to be
associated with good bread-making quality. The isolation of a new low-molecular-weight
glutenin subunit gene, located on chromosome 1D, was reported in {0350}.

82.3.1.4. Glu-4

The following loci, Glu-D4 and Glu-D5, encoding low molecular weight subunits of glutenin
(30-32 kDa) were described in {02111}; the proteins encoded by them were first observed
earlier {02114, 02115}, and the former was later tentatively assigned the symbol Glu-4
{02116}, before its chromosomal location was established and the locus definitively named
as Glu-D4 in {02111}. While this locus is located on chromosome 1D (in accordance with
the position on the group 1 chromosomes of the remaining glutenin encoding loci found to
date), the locus Glu-D5 is located on chromosome 7D. In SDS-PAGE, the proteins from both
loci are detected only in the presence of 4-vinylpyridine added to the sample extract. Their
amino acid compositions do not match those of the major prolamin groups; nonetheless, they
classify as glutenins based upon solubility, immunological behaviour and N-terminal amino
acid sequence (the latter suggesting an evolutionary link with the major (B and C) low
molecular weight glutenin subunits).

Glu-D4{02111}. 1D{02111}. su: CS/Langdon 1D(1A); CS/Langdon 1D(1B){02111}.
Glu-D4a{02111}. v: J 24.
Glu-D4b{02111}. v: PBW 154.
82.3.1.5. Glu-5

\textit{Glu-D5}\{02111\}.  7D\{02111\}.  \textit{su}: CS/Langdon 7D(7A); CS/Langdon 7D(7B)\{02111\}.
\textit{Glu-D5a}\{02111\}.  \textit{v}: PBW 154.
\textit{Glu-D5b}\{02111\}.  Null allele.  \textit{v}: K 68.

A collection of 173 \textit{Ae. tauschii} accessions were analysed for low molecular weight glutenin subunits by SDS-PAGE \{02112\}. Thirty three different patterns for B-subunits and 43 for C-subunits were identified, some of which were of identical electrophoretic mobility to those observed in common wheat. Also observed were subunits with the same mobilities as the D-subunits and as the subunits encoded by the \textit{Glu-D4} and \textit{Glu-D5} loci. This variation represents a source of novel germplasm of potential value for breeding programmes aimed at improving the D-genome of common wheat in the context of bread-making quality.

PCR amplification of genomic DNA was used to isolate three LMW glutenin genes in cultivar Chinese Spring, named LMWG-MB1, LMWG-MB2 and LMWG-MB3 \{01101\}. The deduced amino-acid sequences showed a high similarity between these ORFs and with those of other LMW glutenin genes. The authors state that the study provided direct evidence that insertions and/or deletions provide a mechanistic explanation for the allelic variation, and hence the resultant evolution, of prolamin genes, and comment on relationships with gamma-secalins and beta-hordein families. Single-base substitutions at identical sites generate premature stop codons in both LMWG-MB2 and LMWG-MB3, indicating that these clones are pseudogenes.

82.3.2. Gliadins

These are heterogeneous mixtures of alcohol-soluble polypeptides without quaternary structure. The \textit{Gli-1} loci are compound and are now considered to comprise the omega-gliadin and gamma gliadin \{982,1415\} multigene families \{494\}, which in some circumstances may be divided into \textit{Gli-1-1} and \textit{Gli-1-2}, respectively. The LMW glutenin multigene families, which are closely linked to the \textit{Gli-1} loci \{588\}, are listed separately as the \textit{Glu-3} set \{1358\}; information on map distance and gene order in relation to \textit{Glu-3} and the centromere is given in the preamble for the \textit{Glu-3} loci. There is evidence that a few of the omega-gliadin genes are separated from the main omega-gliadin gene cluster \{993\}. Variation at the \textit{Gli-1} loci was described earlier \{634,996,1126\} and applied in mapping experiments \{1243,1125,196,422,1120\}. A rational system of naming the alleles was produced by Dr. E.V. Metakovsky\{988\}. This nomenclature is reproduced below. A considerable number of alleles were added to the original list given in \{988\}, and referenced here accordingly. A few alleles have been deleted, because, following much detailed comparison, there is now doubt that they can be reliably distinguished from existing alleles \{9981\}. The allelic letter in these cases has not been reused. To facilitate practical use of the list, the aim was to give at least three standard cultivars from a range of countries for each allele \{9981\}. This was achieved for the vast majority of entries and is a change from the original list compiled from \{988\}, where up to two standards were given. While the three or more standards described almost always include the original standards, some have been replaced for various reasons, such as international awareness of the cultivar, availability of seed, or the ease with which an allele can be identified in a particular genetic background \{9981\}. In the original list, where two cultivars were given as prototypes for an allele, the first named was from the USSR and the second from elsewhere; this is no longer the case, although care was taken to include a Russian cultivar where possible, to maintain a wide base of germplasm in which the alleles are available, as well as to acknowledge the research
groups in the country where much of the pioneering work was carried out.
For discussion of null alleles at the Gli-1 and Gli-2 loci, see {9984}. Recombination was observed within the gliadin multigene family at XGli-A1 {277}. These closely linked genes may correspond to Gli-A1 and Gli-A5, but they were temporarily designated XGli-A1.1 and XGli-A1.2 until orthology with Gli-A1 and/or Gli-A5 is established.

Note: The catalogue entries reproduced here only refer to alleles in T. aestivum; there is, however, enormous variation in the gliadins in the close relatives of wheat; see, for example, {989} for studies in T. monococcum (more than 80 gliadin electrophoretic patterns observed in 109 accessions), {990} for studies in T. boeoticum (more than 50 electrophoretic patterns in 60 accessions), and {1076} studies in T. durum (19 electrophoretic patterns, referring only to variation in the omego-gliadins, in 243 accessions).
In {00110}, variants for omega-gliadins were reported from study of twenty-four accessions of einkorn wheat (T. monococcum ssp. monococcum). In {00111}, in a study of common wheat and durum from Portugal, the authors used the nomenclature system described in {00112} for the omega-gliadins. In {00116}, a comparison between spelt and common wheat was carried out for the gliadins using a nomenclature system described in {00118}. The Gli-1 loci may be recognised by probes pcP387 {372} and pTag1436 {065}, and by specific microsatellites primers {252}. Furthermore, it was shown that probe pTag1436 differentiates gliadin alleles rather well; using this probe, families of gliadin alleles and some of their relationships were described {9988}.

Twenty eight gamma-gliadin gene sequences from GenBank were grouped into nine subgroups in {10063}. Primers were developed against some of the subgroups and the chromosomal locations of the gamma-gliadin genes were determined {10063}.

Based upon morphological observation and RFLP analysis, it was proposed that the cultivar 'Chinese Spring' is a strain of the landrace 'Chengdu-guangtou' from the Chengdu Plain, Sichuan Province; this proposal is supported by the observation that CS and the landrace share the same alleles at all nine Gli-1, Gli-2 and Glu-1 loci {see 01102}.
PCR primers GAG5 and GAG6 were applied to 35 cultivars of closely related spelt and hexaploid wheat, and to eight cultivars of durum, to yield products originating from two gamma-gliadin genes mapped to chromosomes 1B (termed GAG56B) and 1D (termed GAG56D) {01103}. Two alleles for GAG56D (differing in a 9 bp deletion/duplication and single nucleotide polymorphism) were found, one a new allele and the other previously published {01104}. Meanwhile two alleles found for GAG56B among the durum wheats correlated with the presence of gluten quality markers, gamma-gliadins 42 or 45.

1B and 1D sulphur-poor omega-gliadins in cultivar Butte 86 were characterised by RP-HPLC, SDS-PAGE, two-dimensional PAGE, amino acid composition determination and sequencing, matrix assisted laser desorption ionisation-time of flight mass spectrometry and circular dichroism spectroscopy to reveal the detailed nature of the peptides belonging to the two groups, and showing that the complexity of mixtures of the peptides of the 1B group was greater than that of the 1D group {01105}. Although circular dichroism spectra were similar for the two groups of peptides, and suggested a mainly flexible random structure, there was evidence for a significant amount of left-handed polyproline II helical conformation in the case of the 1D components. The authors placed some of the results in the context of the possible ancestor of the B-genome and relationships with the barley C-hordeins and rye omega-secalins.
Eleven new gliadin alleles were found in a collection of 52 Spanish landraces of common wheat {03141}. These will be added to the Gli-1 and Gli-2 allelic lists in a later Supplement.
A new family of low-molecular-weight gliadin genes located on groups 4 and 7 were reported in \{10117\}. They appear to influence rheological properties and seem to be closely related to the 17kDa epsilon hordein, important in beer foam stability.

A novel storage protein gene with chimerical structure was isolated from the old Hungarian cultivar Bankuti 1201, containing gamma-gliadin sequences in the 5′ region, LMW-glutenin sequences in the 3′ region and a frameshift mutation leading to a completely new polypeptide in the C-terminal region. A further seven recombinant prolamin genes were subsequently isolated. The eight genes, designated \(\text{Ch1} \) to \(\text{Ch8}\), seem to derive from four gamma-gliadin and three LMW-glutenin sequences and are probably the result of crossing over between the loci \(\text{Gli-1}\) and \(\text{Glu-3}\). However, the precise recombinational mechanism that gave rise to them has yet to be elucidated \{10307\}.

Transcriptome analysis showed the presence of proteins called avenin-like a and b. The former contained a duplicated sequence of about 120 residues and corresponded to the LMW-gliadins. The latter was not previously characterized, but may form part of the glutenin fraction and hence influence quality. These avenin-like proteins showed higher expression levels in three \(\text{Aegilops}\) species (\(\text{Ae. caudata, Ae. cylindrica}\) and \(\text{Ae. tauschii}\)) than in common wheat \{10321\}.

Gli-Ag[1. 1Ag[168]. ad: Vilmorin 27/Th. intermedium.
A locus designated Gli-DT1 controlling an omega-gliadin of Ae. tauschii was mapped on the short arm of chromosome 1D between loci Gli-D1 (strictly Gli-D1) and Glu-D1 (strictly Glu-D1), 13.18 cM proximal to the former and 40.20 cM from the latter [02109]. The only omega-gliadin to date identified as being encoded by this locus, namely T1, is of unusually low electrophoretic mobility in SDS-PAGE gels and was formally thought to be a high
molecular weight glutenin encoded by the Glu-D1 locus of Ae. tauschii (see note following the Glu-D1 list in section 'Glutenins'). The authors speculate that, due to their similar relative map positions, the loci Gl-gli-A4, Gl-gli-D4, Gl-gli-R3, Gl-gli-S4 and this locus, Gl-gli-DT1, form a series of 'Gli-4' orthologous loci. However, this should be interpreted in the light of the above discussion on Gl-gli-A3 and Gl-gli-A4.

A 1,200 bp Dra I RFLP was identified as a gene-specific probe for the T1 omega-gliadin {10645}. Gl-gli-DT1a {02109}. T1. v: L/18913 (synthetic). dv: Ae. tauschii AUS18913.

In barley, the B and C hordeins are controlled by the Hor2 and Hor1 loci, respectively, which are linked {1341} on chromosome 1HS {1063,1153}. The map distances and homology of the proteins indicate that Hor1, the locus closest to the centromere, is equivalent to the omega-gliadins (Gli-1-1) in Gli-1 {1338}.

Three alleles at each of the Gli-1-1 (omega gliadin) loci were noted {1358}. The complexity of the Gli-1 compound loci is further emphasized by a report of individual genes being separable by recombination, where Gld-1A (a block of gamma and omega genes) is separable by 0.3% from Gld4-1A (omega gliadins) which is in turn, separable by 1.5% from Gld3-1A (omega gliadins) {1103}.

Elsewhere, variation was described {634,996,1126} and applied in mapping experiments {107,196,422,1120,1125,1243}. Sixteen combinations of Gli-B1 and 4 combinations of Gli-D1 subunits are listed in {420}. Multiple alleles described in {996}, number 15 at Gli-A1, 18 at Gli-B1, and 8 at Gli-D1.

The Gli-1 alleles present in 57 Yugoslav wheat varieties were reported in {994}.

Glu-S1 is located in 1S1L and the other loci are in 1S1S.
Gli-V3 \([111]\).  4VL \([111]\).  ad: Creso/D. villosum.

82.3.2.4. Gli-4

It is not clear how Gli-S4 and Gli-S5 relate to the Gli-4 and Gli-5 sets described below. A locus designated Gli-A4 controlling omega-gliadins in cv. Perzivan biotype 2 was mapped at 10 cM proximal to Gli-A1 on the short arm of chromosome 1A \([1205]\).

However, Metakovsky et al. \([9983]\) have since shown that this locus and Gli-A3 are, in fact, the same locus. Furthermore, Dubcovsky et al. \([277]\) did not find evidence for the simultaneous presence of both Gli-A3 and Gli-A4 in five 1A or 1Am mapping populations and concluded that Gli-A4 should be considered to be Gli-A3 until conclusive evidence for the former is obtained. For these reasons, the locus Gli-A4 is deleted from the catalogue.

82.3.2.5. Gli-5

A locus designated Gli-5 controlling omega-gliadins was mapped to the short arms of chromosomes 1A and 1B, distal to Gli-1 \([1147]\). The map distance between Gli-B5 and Gli-B1 was estimated as 1.4 cM (recombination value of 1.4 +/- 0.4%), although there was significant variation in recombination values over crosses, ranging from 0 % to 5.9 % over the six crosses analysed. This variation was attributed to genotypic influence on the frequency of recombination.

Gli-A5 \([1147]\).  1AS \([1147]\).  v: Salmoine.
Gli-A5a \([9983]\). Null \([9983]\).  v: CS.
Gli-A5b \([9983]\).  v: Marquis.
Allele Gli-A5b controls two slow-moving, easily-recognizable omega-gliadins. It is present in all common wheat cultivars having alleles Gli-A1m and Gli-A1r (and, probably, in those having Gli-A1e, Gli-A1i and Gli-A1q), because earlier (for example, in \([988]\)) two minor omega-gliadins encoded by Gli-A5b were considered to be controlled by these Gli-A1 alleles \([9983]\).

Gli-B5 \([1147]\).  1BS \([1147]\).  v: Salmoine.
Gli-B5a \([1147]\).  v: CS.
Gli-B5b \([1147]\).  v: Salmoine.

In \([988]\), omega-gliadins controlled by Gli-B5 (allele Gli-B5b) were attributed to alleles at the Gli-B1 locus (alleles Gli-B1c, i, k, m, n and o).

82.3.2.6. Gli-6
**Gli-A6** [9983,9993]. 1AS[9983].

*Gli-A6* was first explicitly described in [9983], but it was first observed without designation in [993]. There is strong evidence that it is distinct from *Gli-A3* and *Gli-A5*, mapping distally to *Gli-A1*, with which it recombines at a frequency of 2-5%. Currently three alleles are known, of which *Gli-A6c* is particularly well-described in [9983]: the molecular mass of the omega-gliadin controlled by this allele is slightly lower than those of the omega-gliadins controlled by *Gli-A3* alleles. In [988], the omega-gliadin controlled by *Gli-A6c* was attributed to *Gli-A1f*. *Gli-A6c* is rather frequent in common wheat and may relate to dough quality (preliminary data [9983]). *Gli-A6a* is null [9983].

*Gli-A6b* [9983]. v: Bezenchukskaya 98.

*Gli-A6c* [9983]. v: Courtot, Anda, Mironovskaya 808.

### 82.3.2.7. Gli-7

**Gli-A7** [10547]. 1DS{10547}. dv: AUS18913{10547}.

The gamma-gliadin encoded by this locus co-segregated with the T1 omega-gliadin encoded by the *Gli-D'T1* locus (currently included in the Catalogue as locus (Gli-D'T1). *Gli-A7* was located 0.69 cM from *Gli-D'T1* [10547].

Four new classes of low molecular weight proteins related to gliadins, though not sufficiently similar to be classified as such, were reported in [02113]. One of the classes has no close association to previously described wheat endosperm proteins.

### 82.3.3. Other endosperm storage proteins

**Tri-A1** [1357, 1358]. 1AS{1357}. v: CS.

**Tri-A1a**. [\#{1358}]. v: CS.

**Tri-A1b**. [\#{1358}]. v: Hope.

**Tri-D1** [1357,707,1358]. 1DS{1357}. v: CS.

**Tri-D1a**. [\#{1358}]. v: CS.

**Tri-D1b**. [\#{1358}]. v: India 115.

### 82.3.3.1. Triticin proteins

The triticin proteins [1360] or [Triplet proteins [1357]] are storage globulins with homology to pea legumins and related proteins in oats, rice and several dicotyledonous species [1360]. Triticin gene segments including its hypervariable region were PCR-amplified, with preferential amplification of *Tri-D1* for the only pair of primers giving consistent results [10322].

### 82.4. Enzyme Inhibitors

#### 82.4.1. Inhibitors of alpha-amylase and subtilisin

**Isa-A1** [908]. 2AL[908]. v: CS.

**Isa-A1a** [908]. v: CS.

**Isa-A1b** [908]. Null allele. v: Cajeme 71.

**Isa-B1** [908]. 2BL[908]. v: CS.

**Isa-B1a** [908]. v: CS.
Orthologous genes were identified in *Ae. speltoides* and *T. timopheevii* {908}. All durum wheats investigated had the genotype *Isa-A1b, Isa-B1b*.

82.4.2. Inhibitors (dimeric) of heterologous alpha-amylases

Chromosome 3BS has duplicated loci controlling two dimeric inhibitors of exogenous alpha-amylases, one known as 0.53 or Inh I {1260}, and the other as WDA I-3 {1260}.

Chromosome 3DS has a homoeologous locus controlling a dimeric inhibitor of exogenous alpha-amylases, known as 0.19 or Inh III {1260,0124}, that is closely related to 0.53/Inh I.

Intervarietal polymorphism for the WDA-3 protein was identified by isoelectric focussing of water-soluble endosperm proteins {0124}. This was interchromosomally mapped on 3BS using both a DH population of Cranbrook/Halberd, and a set of RILs of Opata 85/W-7984 (ITMI population) {0125}.

Three genome allele specific primer sets were designed for the 3BS and 3DS alpha-amylase inhibitors in cv. Chinese Spring, based upon SNPs. Their validity was confirmed in 15 accessions of *Triticum urartu, Triticum monococcum, Aegilops tauschii* and *Triticum dicoccoides*. The results offered support that the 24kDa dimeric alpha-amylase inhibitors in cultivated wheat are encoded by a multigene family {10323}, previously proposed in {10324}, as the result of phylogenetic analysis of sequences characterized by cSNPs.

82.4.3. Subtilisin inhibition

- **Si-R1** {529}. 2R{529}.2RS{701}. *ad*: CS/Imperial, Holdfast/King II.
- **Si-H1** {528}. *ad*: CS/Betzes.

- **Si-B2** {701}. 1BS{701}. *su*: Bersee {Koga II}.
- **Si-D2** {701}. *ad*: Koga II.

- **Si-H2** {528}. {701}. *ad*: CS/Betzes.
- **Si-R2** {529}.1R{529}.1RS{701}. *ad*: CS/Imperial{529}. *tr*: Gabo 1BL.1RS{701}.

- **Si-S2** {701}. *ad*: CS/Ae. longissima.
- **Si-U2** {701}. *ad*: CS/Ae. umbellulata.

Considerable genetic variation for *Si-2* was noted in {701}. A chromosome location for *Si-H2* on 1HL was inferred in {528} but questioned in {701}.

Three subunits of the wheat tetrameric inhibitor of insect a-amylase, CM1, CM3 and CM16, with homology to the dimeric and monomeric a-amylase inhibitors and the trypsin inhibitors, were located by Southern analysis of cDNAs pCT1, pCT2, and pCT3 to 4A, 4B, 4D; 7A, 7B, 7D; and 4A, 4B, 4D, respectively {427}.

Genes encoding proteins which inhibit the action of mammalian and insect, but not cereal, a-amylases, were located in chromosomes 3BS, 3DS and 6DS of Chinese Spring {1260}. Also, genes encoding inhibitors of insect a-amylases were located in *H. chilense* chromosomes 4F<sub>ch</sub> and 7F<sub>ch</sub> {1262}.

82.4.4. Trypsin inhibition
82.5. Other proteins

82.5.1. Grain softness protein

Gsp-I{1185}.

Gsp-A1{614}.  [GSP{614}].  5A{614,0383}.  v: CS{614,0383}; Rosella (GenBank AF177218){0383}.

82.5.6. Puroindolines and grain softness protein

Puroindolines a and b are the major components of friabilin, a protein complex that is associated with grain texture (see 'Grain Hardness'). The name 'puroindoline' and the complete amino acid sequence of puroindoline a were given in \{0382\} from cv Camp Remy. Hard grain texture in hexaploid wheat results from unique changes in the puroindoline amino acid sequence or, currently, four null forms \{0295\} of the completely linked genes (max. map distance 4.3 cM) \{452\}. Tetraploid (AABB, AAGG) wheats lack puroindolines and are consequently very hard \{03103\}. A searchable database of wheat varieties and their puroindoline genotype is available at http://www.wsu.edu/~wwql/php/puroindoline.php. Grain softness protein-1 is a closely related gene which is closely located to the puroindoline genes \{03111,1185\}. 'GenBank' and 'dbEST' refer to sequence databases available at NCBI (also available through EMBL and DDB).

Recent reviews \{10522, 10523\} provide comprehensive descriptions of the molecular genetics and regulation of puroindolines. Morris and Bhave \{10524\} reconciled the D-genome puroindoline alleles with DNA sequence data. Bonafede et al. \{10525, 10526\} developed a CS line (PI 651012) carrying a 5AmS.5AS translocation from *T. monococcum*; the translocated chromatin carries A-genome *Pina, Pinb* and *Gsp-1* alleles that confer softer kernel texture.

**Pina-A1** \{03103,03108,03104\}.  dv: *T. urartu* unspecified accession \{03103\}; TA763(GenBank AJ302094)\{03108,03104\}; TA808(GenBank AJ302095)\{03108,03104\}.

**Pina-D1** \{452\}. 5DS \{452\}.  v: CS (GenBank DQ363911)\{03108\}; Capitole (GenBank X69914)\{03110\}.
This locus has a large deletion encompassing genes *Pina-D1, Pinb-D1* and *Gsp-D1*. This allelic combination confers a harder kernel texture than *Pina-D1a/Pinb-D1b* \{10077\}.

**Pina-D1a** \{452\}.  v: Bellevue\{0249\}; Capitole (GenBank X69914)\{03110\}; Courtot\{0249\}; Fortuna\{0249\}; Galaxie\{0249\}; Heron\{1035\}; Renan (GenBank CR626934)\{10440\}; Soissons\{0249\}.  v2: Aurelio *Pinb-D1a*\{0249\}; Bezystaja *Pinb-D1b*\{0249\}; Bilancia *Pinb-D1a*\{0249\}; Bolero *Pinb-D1a*\{0249\}; Brasilia *Pinb-D1b*\{0249\}; Centauro *Pinb-D1a*\{0249\}; Cerene *Pinb-D1b*\{0249\}; CS *Pinb-D1a*\{452,0249\}; Colfiorito *Pinb-D1b*\{0249\}; Cologna 21 *Pinb-D1b*\{0249\}; David *Pinb-D1b*\{0249\}; Democrat *Pinb-D1b*\{0249\}; Etruria *Pinb-D1b*\{0249\}; Francia *Pinb-D1b*\{0249\}; Gemini *Pinb-D1b*\{0249\}; Genio *Pinb-D1b*\{0249\}; Gladio *Pinb-D1b*\{0249\}; Lampo *Pinb-D1a*\{0249\}; Leone *Pinb-D1a*\{0249\}; Leopard *Pinb-D1a*\{0249\}; Libero *Pinb-D1a*\{0249\}; Livio *Pinb-D1a*\{0249\}; Marberg *Pinb-D1b*\{0249\}; Mentana *Pinb-D1a*\{0249\}; Mieti *Pinb-D1b*\{0249\}; Mose *Pinb-D1a*\{0249\}; Neviana *Pinb-D1a*\{0249\}; Newana *Pinb-D1b*\{0249\}; Oscar *Pinb-D1a*\{0249\}; Pandas

\( \text{Glo-R1\{455\}} \), 1RS\{455\}.  \text{ad: CS/Imperial.  su: 1B/(1R), eg., Salzmunde 14/44.}

82.5.9. Serine protease inhibitors

Serine proteinase inhibitors or serpins are salt soluble proteins (-43 kDa) representing about 4% of the total protein in wheat and barley endosperms. They may have a role in plant defense.

\( \text{Srp-A1\{10754\}} \), 5AL\{10754\}.

\( \text{Srp-B1\{10754\}} \), 5BL\{10754\}.  \text{Srp5B\{10754\}}.  \text{5BL\{10754\}.}

\( \text{Srp-B1a\{10754\}} \), \[ \text{Srp5Ba\{10754\}} \].  \text{v: Etawah\{10755\}; Federation\{10755\}; Frame\{10755\}; Pugsley\{10754\}; Stylet\{10755\}.}

\( \text{Srp-B1b\{10754\}} \).  \text{Null allele v: Correll\{10755\}; EGA Eagle Rock\{10755\}; Gladius\{10755\}; Yitpi\{10755\}.}

This allele reduced milling yield by 0.4% \{10755\}.

\( \text{Srp-D1\{10754\}} \). 5DL\{10754\}.

82.5.10. Starch granule proteins

The proteins, designated SGP-1, are starch synthases, encoded by \( \text{SsII-A1, SsII-B1 and SsII-D1} \) \{0042\}.

\( \text{Sgp-A1\{1615\}} \), 7AS\{1615\}.  \text{v: CS.}

\( \text{Sgp-A1a\{1615\}} \).  \text{v: CS.}

\( \text{Sgp-A1b\{1615\}} \).  \text{Null allele. v: Chosen 30, Chosen 57.}

\( \text{Sgp-A1c\{1615\}} \).  \text{v: Hua Non 9.}

\( \text{Sgp-B1\{1615\}} \), 7BS\{1615\}.  \text{v: CS.}

\( \text{Sgp-B1a\{1615\}} \).  \text{v: CS.}

\( \text{Sgp-B1b\{1615\}} \).  \text{Null allele. v: K79.}
The proteins, designated SGP-3, are identical to wheat starch synthase I, encoded by *SsI-A1*, *SsI-A2* and *SsI-D1*. A triple null stock (SGP-1 null wheat) is reported in {0137}. Deletion mapping indicated that the gene order on the 7S arms is; centromere - *Sgp-1* - SGP-3 - Wx {1615}.

### 82.5.11. Starch synthase

- **SsI-A1** {0041}. 7A {0041}.
- **SsI-B1** {0041}. 7B {0041}.
- **SsI-D1** {0041}. 7D {0041}.

Starch synthase I proteins are identical to the starch granule proteins SGP-3 {0041}.

- **SsII-A1** {0042}. 7A {0042}.
- **SsII-B1** {0042}. 7B {0042}.
- **SsII-D1** {0042}. 7D {0042}.

Starch synthase II proteins are identical to the starch granule proteins SGP-1 {0042}.

### 82.5.12. Water soluble proteins

WSP-1 are monomeric grain endosperm proteins identified by their high pI's {817}.

- **Wsp-A1** {817}. 7AL {817}. v: CS.

- **Wsp-E1** {817}. 7E {817}. ad: CS/ *E. elongata.*
82.5.13. Waxy proteins

Waxy protein (granule-bound starch synthase = ADP glucose starch glycosyl transferase, EC 2.4.1.21 = GBSSI) is tightly bound within endosperm starch granules and is involved in the synthesis of amylose {1616}. Waxy variants, characterised by starch granules containing increased amylopectin and reduced amylose, are preferred for Japaness white salted or "udon" noodles {1650}. Similar waxy phenotypes are controlled by orthologous genes in barley, maize and rice but are not known to occur in rye {725}. All combinations of the null alleles were produced in Chinese Spring {0018}. Partial genomic clones of various diploid, tetraploid, and hexaploid wheats were sequenced {0278,0279}.

A multiplex PCR assay for identifying waxy genotypes is described in {10032}.

A variant allele was present in one Iranian and one Italian accession{03101}.

Various hard and soft wheats with the alleles *Wx-A1b, Wx-B1b* and *Wx-D1b* are listed in {0304}. Fifteen percent of Chinese wheats possessed *Wx-B1* null alleles {10357}.

Lists of cultivars, lines and landraces of tetraploid and hexaploid wheats with different, mostly null, alleles at the *Wx* loci are given in {9910,9911,9912,1053,1054,9913,9915,9916,1650,9917}.

The complete genomic sequence for *Wx-D1a* from CS {0073} and the cDNA sequence for the *Wx-D1b* allele from Bai Huo {0075} were determined.

Isolation of a wheat cDNA encoding *Wx-A1* and *Wx-D1* was reported in {0123} and {0167}, respectively. Isolation of genomic sequences for the genes encoding granule-bound starch synthase (*GBSSI* or *Wx*) in *T. monococcum, Ae. speltoides* and *Ae. tauschii* was reported in {0168}. Cloning of a second set of *GBSSI* or *waxy* genes, *GBSSII*, which were shown to be located on chromosomes 2AL, 2B and 2D, was reported in {0167}.

Various hard and soft wheats with the alleles *Wx-A1b, Wx-B1b* and *Wx-D1b* are listed in {0304}. Fifteen percent of Chinese wheats possessed *Wx-B1* null alleles {10357}.

83. **Abiotic Stress Responses:Dehydrin-response Element Bionding Factors**

DREB proteins are a large family of transcription factors induced by abiotic stresses. Using genome-specific primers as an orthologous *Dreb1* gene series was placed on chromosomes 3A, 3B and 3D {10729}. SNPs in *Dreb-B1* permitted mapping in chromosome 3BL in the ITMI (Opata 85 / W7984) mapping population.

**Dreb-B1**{10729}. 3BL{10729}. \(ma\): *Xmwg818*-3B - 27.3 cM - *Dreb1* - 11.2 cM - *Xfbb117*-3B{10729}.

**Dreb-B1a**{10729}. \(v\): Opata 85{10729}.

**Dreb-B1b**{10729}. \(v\): W7984{10729}.
Pathogenic Disease/Pest Reaction

For disease/pest reaction gene guidelines see Introduction, no. 8.

Note: In listings of multiple alleles, the chromosome locations and ma: citations will generally be given with the particular allele that was located or mapped.

84. Reaction to Barley Yellow Dwarf Virus

Disease: Cereal yellow dwarf

- Nemares Pm1 Pm2Pm4b Pm6 Pm9 {1287};
- Planet, Sappo & Walter Pm1 Pm2 Pm4b Pm9 {096,097,540,1287,1428}

Scandinavian wheats {10681}.

**86.2. Suppressors of Pm**

Some wheats which, on the basis of cytological and rust tests carry 1RS from Petkus rye, do not express resistance due to presence of a suppressor {385}. Zeller & Hsam {1625} located a suppressor of Pm8 and Pm17 in chromosome 7D of Caribo. Mildew resistance was suppressed in Florida, Heinrich, Ikarus, Olymp and Sabina, which are derivatives of Caribo with 1BL.1RS. According to Ren et al. {1209}, SuPm8 does not suppress Pm17. Hanusova et al. {492} listed 16 wheats that carry a suppressor of Pm8; 111 wheats did not carry the suppressor. In contrast, a high frequency of suppression occurred in CIMMYT wheats {108,1208}. Further genotypes are identified in {491}. Although Line 81-7241 carries Pm8 as well as Pm23, evidence was presented to indicate that Pm8 was suppressed in Line 81-7241{1618} and, by inference, indicated that Chinese Spring possessed SuPm8.

**SuPm8**{1209}. 1AS{1209}. v: Wheats with Gli-A1a{1209} including CS; Lists in{108,491,1208}.

Pm8 was suppressed when locus Pm3 is transcribed (including Chinese Spring and Thatcher which have no currently detectable Pm3 resistance alleles) {10828}.

**86.3. Temporarily designated genes for resistance to Blumeria graminis**

86.4. QTLs for resistance to Blumeria graminis

QTL: Several QTLs were detected in two RE714/Hardi populations when tested at two growth stages and with different cultures over three years. The most persistent and effective QTL was located in the vicinity of Xgwm174-5D {0272}. Three QTLs, QPm.vt-1B, QPm.vt-2A and QPm.vt-2B, with additive gene action, accounted for 50% of the variation in a population developed from Becker/Massey {0284}.

These QTLs were confirmed by the addition of extra markers to the Becker/Massey map and in a separate analysis of USG 3209 (A Massey derivative)/Jaypee (susceptible) {10505}. USG 3209 possessed Pm8 (1BL.1RS) and an unknown specific resistance factor and their combination had a positive effect on APR even though neither was effective against the races used to identify the QTL {10505}.

QTLs on chromosomes 1A, 2A, 2B, 3A, 5D, 6A and 7B were detected in a RE714/Festin population in multiple locations and over multiple years. The QTL on chromosome 5D was detected in all environments and all years and was associated with markers Xgwm639-5D and Xgwm174-5D. Resistance was contributed by RE714. A QTL coinciding with MIRE on 6A was also detected in all environments. The QTL on chromosome 5D and 6A accounted for 45% to 61% of the phenotypic variation {0354}.

Avocet R(S)/Saar (R) F6 RILs: QTL located on chromosomes 1B (close to Xwmc44-1B) (Pm39), 7DS (Xgwm1220-7D) (Pm38) and 4BL (XwPt-6209) (resistance allele from Avocet R {10481}.

The relationship of Fhb2 to Fhs1 or Fhs2 \{1096\} is unknown.

Fhb3\{10529\}. 7DS = T7AL.7Lr#1S\{10529\}. v: TA 5608\{10529\}. al: Leymus racemosus\{10529\}. ma: Three PCR markers, Be586744-STS, BE404728-STS and BE586111-STS, were developed\{10529\}.
The level of type 2 resistance conferred by Fhb3 was similar to that of Sumai 3 \{10529\}.

Fhb4\{10884\}. [Qfhi.nau-4B\{10282\}]. 4BL\{10282,10883\}. bin: 4BL5-0.86-1.00. i: Mianyang 99-323^4/Nanda 2419/Wangshibai\{10885\}. v2: Wangshuibai Fhb5\{10884\}. ma: Located in a 1.7 cM segment flanked by Xhbg226-4B and Xgwm149/Xmag4580-4B\{10883\}.

Although plants with Fhb-4 were taller than the recurrent parent, the height difference was not associated with the Rht-B1 locus \{10885\}.

Fhb5\{10896\}. [Qfhi.nau-5A\{10282\}]. 5AS\{10896\}. bin: C-5AS3 0.75. i: Mianyan 99-323 and PH691 backcross derivatives selected for Qfhi.nau-5A\{10896\}. v2: Wangshuibai Fh4b\{10896\}. ma: Located in a 0.3 cM interval between Xbarc117/Xbarc358/Xgwm293/Xgwm304-5A and Xgwm415-5A\{10896\}.

A major QTL was associated with several linked AFLP markers tentatively located in chromosome 7BL of Ning 7840\{0005\}.

QTLs for resistance to Fusarium graminearum detected in the cross Renan/Recital \{10069\}. All resistance alleles, except QFhs.inra-3A, were contributed by Renan. LOD scores and percent of variation explained by the QT (R^2) are average of three years of field tests.

QFhs.inra-2A\{10069\}. ma: Associated with Xgwm382c-2A (LOD=6.3, R^2=14.4%).
QFhs.inra-2B\{10069\}. ma: Associated with Xgwm374-2B (LOD=7.6, R^2=12%).
QFhs.inra-3A\{10069\}. ma: Associated with Xbcd372-3A (LOD=3.7, R^2=6.2%).
QFhs.inra-3B\{10069\}. ma: Associated with Xgwm383b-3B (LOD=5.4, R^2=10.5%).
QFhs.inra-5A.1\{10069\}. ma: Associated with Xpsr170a-5A (LOD=3.8, R^2=5%).
QFhs.inra-5A.2\{10069\}. ma: Associated with Xgwm639b-5A (LOD=6.6, R^2=14%).
QFhs.inra-5A.3\{10069\}. ma: Associated with B1 (LOD=6.3, R^2=8.5%).
QFhs.inra-5D\{10069\}. ma: Associated with Xcdf29-5D (LOD=4.4, R^2=7%).
QFhs.inra-6D\{10069\}. ma: Associated with Xcdf32-6D (LOD=2.7, R^2=6.6%).
QFhs.ndsu-2A\{9925,0175\}. 2AL\{9925\}. v: Sumai 3/Stoa RI mapping population; the QTL was contributed by Stoa\{9925\}. ma: Association with RFLP XksuH16-2A (LOD=3\{9925\}.

QFhs.ndsu-3AS\{10482\}. 3AS\{0372\}. tv: T. turgidum var. dicoccoides. Recombinant substitution lines LDN and LDN(Dic-3A). The resistant allele was contributed by T. dicoccoides\{0372\}. ma: Associated with Xgwm2-3A (explained 37% of the phenotypic variation)\{0372\}; QFhs.ndsu-3AS was placed within a 11.5 cM region flanked by TRAP marker loci Xfcp401-3A and Xfcp397.2-3A\{10482\}; This gene is unlikely to be a homoeologue of Qfhs.ndsu-3BS = Fhb1\{10482\}.
QFhs.ndsu-3B\{9925,0175\}. 3BS\{9925\}. v: Sumai 3/Stoa RI mapping population; the QTL was contributed by Sumai 3 \{9925,0175\}. ma: Association with Xbcd907-3B.2 (LOD>3) \{9925\} and microsatellite markers Xgwm1533-3B and Xgwm493-3B\{0175\}; QFhs.ndsu-3B from Sumai 3 was associated with microsatellite loci Xgwm533-3B and Xgwm274-3B in certain Sumai 3 derivatives \{10062\}. In Ning 894037 the QTL has the same location and similar SSR bands to Sumai 3 \{10085\}. STS marker SRST.3B1 was mapped between Xgwm533-3B and Xgwm493-3B \{0175\}; QFhs.ndsu.3B was associated with markers Xgwm533-3B, Xbard133-3B, Xbarc147-3B and Xgwm493-3B \{10073\}.

This QTL explained 42\% of the variation in Sumai 3/Stoa\{0175\}. Two additional QTL for resistance to Fusarium graminearum were identified in the cross Sumai3/Stoa \{0175\}. The QTL on 4BS was associated with Xwg909-4B and the QTL on 6BS was associated with Xbarc101-6B and Xbcd1383-6B \{0175\}. The QTL associated with markers Xgwm493-3B/Xgwm533-3B (explaining 24.8 \% of the variation), and Xbarc101-6B/Xbcd1383-6B were also identified in a RIL population from the cross ND2603/Butte 86 \{0175\}. In addition, one QTL on chromosome 3AL associated with Xbcd941-3A and one on chromosome 6AS associated with XksuH4-6A were identified in RILs from the cross ND2603/Butte 86 \{0175\}.

Resistance QTL on chromosome 3BS associated with Xgwm493-3B and Xgwm533-3B was also identified in a DH population of the cross Remus/CMS-82036 (a Sumai 3 derivative) \{0240\}. Additional QTL in this cross were detected on chromosome 5A, associated with Xgwm293-5A and Xgwm304-5A, and possibly on 1B, associated with Glu-B1 \{0240\}.

Two major genes with additive effects were reported in crosses between Sumai 3 (resistant) and two susceptible cultivars \{0174\}. One of the genes was assigned to 5AL based on linkage to the dominant awn suppressor B1 (RF 15.1-21.4\%).

QTLs were located in 3BS, 2BL and 2AS in Ning 7840/Clark. The most effective QTL was probably in interval, flanked by deletions 3BS-3 and -8 and was close to Xgwm533-3B and Xbarc147-3B \{0328\}.

A marker study found that 14 of 66 wheats with putative FHB resistance shared markers indicative of the 3BS QTL in Ning 7840, Sumai 3, Wangshuibai and possibly Wuhan 3, plus Japanese landraces Shinchunaga and Shirasu No 1 \{10115\}. The original source may be the landrace 'Taiwan Wheat' rather than Funo \{10115\}. Four QTLs on chromosomes 3BS (associated with Xbarc133-3B), 3BL (Xgwm247-3B) and 3AS (Xgwm5-3A) from Huapei 57-2, and 5BL (Xbarc59-5B) from Patterson, were reported in the cross Huapei 57-2/Patterson \{10026\}. Huapei 57-2, Ning 7840 and Sumai 3 carried common alleles in the Xgwm533-3B, Xgwm493-3B, Xbard147-3B and Xbarc133-3B region \{10026\}.

Wuhan-1/Nyubai \{10623\}: Two QTLs were located on chromosomes 2DL and 3BS (distal) \{10020\}.

G16-92(R)/Hussar(S): Two QTL for resistance to F. culmorum were identified on chromosome 1A (resistance from Hussar) \(R^2 = 0.01\) and 2B (resistance from G16-92) \(R^2 = 0.14\) \{10588\}.

Of 54 lines with reported FHB resistance, 6, including CM-82036, Ning 7840 and Wuhan 3, had the same 5-marker haplotype as Sumai 3, and 4 lines possessed 4 of the markers.
Twenty-nine lines, including Frontana, has no marker allele in common with Sumai 3, whereas 13 lines had 1 to 3 alleles in common with it \{10113\}. *Qfhs.ndsu-3B* and the 5 marker loci were placed in 3BS deletion bin 0.78-0.87 \{10144\}.

Nanda2419(S)/Wangshuibai(R): 8 QTLs were identified; those with large effects were associated with Xgwm533-3B.3 - Xgwm533-3B.1 (W), Xwmc539-6B (W) and Xs1021m-2B - Xgwm47-2B \{10190\}.

Type I resistance (% infected plants) in this cross was attributed to 10 chromosome regions among which *Qfhi.nau-4B* (Xwmc349-4B - Xgwm149-4B - $r^2=0.75$), *Xfhi.nau-5A* (Xwmc96-5A - Xgwm304-5A - $R^2=0.27$) and *Qfhi.nau-5B* (Xgwm408-5B - Xbarc140-5B) from Wangshuibai were detected in at least 3 of 4 years \{10282\}. A significant additive effect of QTL on 6D and 2A was also observed \{10282\}.

Type IV resistance (proportion of Fusarium-damaged kernels) was attributed to five QTLs, four from Wangshuibai. Those with the largest effects included *QFdk.nau-2B* (from Nanda 2419), *QFdk.nau-3B* and *QFdk.nau-4B* \{10577\} with each accounting for more than 20% of the phenotype variation.

Pelikan (S)/G93010 (=Bussard / Ning 8026) (R). *Qfhs.Ifl-7BS/5BL* and *Qfhs.Ifl-6BS* (probably *Fhb2*) from Ning 8026 reduced disease severity by 30% and 24%, respectively, and by 46% when combined \{10594\}. Other resistance genes were located on chromosomes 1AS (*Qfhs.Ifl-1AS* from Pelikan), and 2AL and 7AL (from Ning 8026) \{10594\}.

Spark (MR)/Rialto(S) DH population: Of nine QTLs identified across all environments, seven alleles for resistance came from Spark and two from Rialto. The largest effect on Type 1 resistance (*Xfhs.jic-4D.2*) was associated with the *Rht-D1b* allele in Rialto which made lines more susceptible. Other QTLs occurred on chromosomes 1B (1B.1R), 4D (*Qfhs.jic-4D.2*), 2A,3A (each, 2 QTLs), 5A and 7A. *Xfhs.jic-4d.2* had little effect on Type 2 resistance \{10603\}.

Wangshuibai/Seri 82:F3:F5 population: QTL on chromosome 3BS (Xgwm533-3B - Xs18/m12-3B) and 2DL(Xgwm539-2D - Xs15/m24-2D) accounted for 17% and 11%, respectively, of the phenotypic variance \{10264\}.

Wangshuibai/Alondra 'S': A stable QTL was associated with Xgwm533-3B in each of 3 years, QTLs in 5B (Xgwm335-5B), 2D and 7A were detected in 2 years \{10268\}.

Wangshuibai(R)/Wheaton(S): QTLs located in chromosome 3BS (Xbarc147-3B, $R^2=37\%$ & Xbarc344-3B, $R^2=7\%$), 7AL (Xwms1083-7A, $R^2=10\%$) and 1BL (Xwms759-1B, $R^2=12\%$) \{10200\}.

Chokwang (R)/Clark (S): *Qfhb.ksu-5DL.1* associated with Xbarc239-5D ($R^2=0.24$) \{10276\}, *Qfhb.ksu-4BL.1* associated with Xbarc1096-4B ($R^2=0.13$) \{10276\}, and *Qfhs.ksu-3BS.1* marginally associated with the region of *Fhb1* ($R^2=0.1$) \{10276\}.

Ernie(Res)/MO94-317(Sus): 243 F8 RIL population. Four QTLs from Ernie detected as follows: *Qfhs.umc-2B*, linked to Xgwm278-2BS, $R^2 = 0.04$ \{10456\}. *Qfhs.umc-3B*, linked to Xgwm285-3BS, $R^2 = 0.13$ \{10456\}. *Qfhs.umc-4B*, linked to Xgwm495-4BL, $R^2 = 0.09$ \{10456\}. *Qfhs.umc-5A*, linked to Xgwm165-5A, $R^2 = 0.17$ \{10456\}. Evidence was provided to suggest the QTL acted additively \{10456\}.
Associations between response to FHB caused by *F. culmorum* and the semi-dwarfing locus *Rht-D1* in crosses Apache/Biscay, Romanus/Pirat and History/Rubens (Biscay, Pirat and Rubens carry *Rht-D1b*) were reported in {10574}. Genotypes with the semi-dwarf alleles tended to be more susceptible.

A review of 52 mapping studies is provided in {10593}. Seedling resistance to *Fusarium graminearum* (FSB). A QTL for FSB resistance in the Wuhan/Nyubai population was associated with the *Qwmc75-5B* locus, R² = 0.138. The relationship of this resistance to crown rot resistance is unknown {10624} (see Reaction to *F. pseudograminearum*).

**Tetraploid wheat**

Langdon/Langdon (DIC-2A) RICL population: Increased susceptibility of the *T. dicoccoides* Israel A substitution line relative to Langdon was mapped to a 22 cM interval spanned by Xgwm558-2A and Xgwm445-2A {10613}.

**QFhs.pur-2D**{10085}.  v: Alondra{10085}.  ma: Located on 2DS between SSR markers Xgwm926-2D and Xgwm261-2D{10085}.

**QFhs.pur-7El**{10489}.  7el₂{10489}.7DS.7DL-7el₂{10489}  su: K2630{10489}.  v: K11695 = 7DS.7DL-7el₂{10489}; KS10-2 = 7el₂S.7el₂L-7DL{10489}; KS24-1 and KS24-2 = 7DS.7el₂{10489}.  ma: *Qfhs.pur-7el₂* was flanked by BE445653 and Xcfa2270-7D{10489}.

These markers were also present in KS10-2{10489}.

**Qfhs.fal-5A**{10076}.  tv: Strongfield{10445}.  ma: Spanning 16 cM, this QTL peaking on Xgwm55-2B explained 23% of the phenotypic variation{10445}.

**Qfhs.fal-3AS**{10041}.  suv: LDN-DIC3A{10042}.  tv: *T. dicoccoides*{10042}.  ma: Located in an interval spanning 29.3 cM this QTL accounted for 37% of the phenotypic variation; peak marker, Xgwm2-3A{10042}.

**Qfhs.fal-6BS**{10041}.  tv: *T. turgidum* var. *carthlicum* cv. Blackbird{10445}.  ma: Spanning 23 cM and peaking on Xwmc397 this QTL accounted for 23% of the phenotypic variation{10445}.

**Qfhs.fcu-7AL**{10041}.  suv: LDN-DIC 7A{10041}.  tv: *T. turgidum* var. *dicoccoides* PI 78742{10041}.  ma: Located in an interval 39.6 cM thie QTL accounted for 19% of the phenotypic variation in a RIL population of Langdon/LDN-DIC 7A; nearest marker Xbarc121-7AL{10041}.

Strongfield/*T. carthlicum*(Blackbird): Field resistance identified in chromosome 2BL (Xgwm55-2B), and 6BL(Xwmc397-6B) (coincident with *Fhb2* {10225}.

**Arina(R)/Forno(S):** Three QTLs, *QFhs.fal-6DL* (R²=22%), *QFhs.fal-5BL.1* (in Forno, R²=14%) and *QFhs.fal.4AL* (R²=10%) and 5 minor QTLs in 2AL, 3AL, 3BL, 3DS and 5DL were detected {10172}.
Arina/Riband DH lines: QTL affecting ADUPC were identified in 1BL(2), 2B, 4DS, 6BL and 7AL (Arina), and 7AL and 7BL (Riband). The most effective was the 4DS QTL that appeared to be an effect of Rht-D1a rather than height per se \{10464\}.

Kansas (moderately resistant)/Ritmo (susceptible): Map based analysis across environments revealed seven QTL, \textit{QFhs.whs-1BS} (1RS), \textit{QFhs.whs-3B} (not \textit{Fhb1}), \textit{QFhs.whs-3DL}, \textit{QFhs.whs-5BL}, \textit{QFhs.whs-7AL} and \textit{QFhs.whs-7BL} (cumulatively, $R^2 = 0.56$). The chromosome 1D gene was primarily involved in resistance to fungal penetration and the others in resistance to spread \{10503\}. There were significant correlations of FHB response with height and heading date \{10503\}.

More detailed mapping led to the relocation of the 5B QTL to chromosome 1BL. The renamed \textit{Qfhs.lfl-1BL} reduced FHB severity by 42% relative to line lacking it \{10698\}. This gene was also present in Biscay, History and Pirat \{10698\}.

Three RGA sequences putatively assigned to chromosome 1A explained 3.37-12.73% of the phenotypic variation in FHB response among F7 and F10 populations \{10364\}. STS marker \textit{FHBSTS1A-160} was developed from one of the RGA.

Dream(R)/Lynx(S) RIL population. Following inoculation with \textit{F. culmorum} 4 QTL for AUDPC were identified on chromosomes 6AL ($R^2=19\%$), 1B (12\%), 2BL (11\%) and 7BS (21\%). The resistance allele in 1B came from Lynx and was associated with \textit{T1BL.1RS} \{10260\}.

Dream*4/Lynx lines were developed by selection of QTL on chromosomes 6AL, 7BS and 2BL. Lines carrying \textit{QFhs.lfl-6AL} and \textit{QFhs.lfl-7BS} were more resistant than lines lacking them; the 2BL QTL effect was not verified \{10470\}.

Frontana(R)/Remus(S): Major QTLs in chromosomes 3AL (\textit{Xgwm270-3AL} - \textit{Xdupw227-3A region}) and 5A (\textit{Xgwm129-5A} - \textit{Xbarc-5A region}) accounted for 16\% and 9\% of the phenotypic variation (mainly type 1 resistance) over 3 years \{10174\}.

Frontana(MR)/Seri82(S), F3 and F3:5 populations: QTLs were located in chromosomes 1BL ($R^2=7.9\%$), flanked by AFLP markers, 3AL (\textit{R}^2=7.7\%), flanked by \textit{Xgwm720-3A} and \textit{Xgwm121-3A}, 7AS (\textit{R}^2=7.6\%), flanked by an AFLP and \textit{Xgwm233-7A} \{10349\}.

Veery (S) / CJ9306 (R): Four QTLs, \textit{XQFhs.ndsu-3BS} (\textit{Xgwm533b} - \textit{Xgwm493}), \textit{QFhs.nau-2DL} (\textit{Xgwm157} - \textit{Xwmc-041}), \textit{QFhs.nau-1AS} (\textit{Xwmc024} - \textit{Xbarc148}) and \textit{QFhs.nau-7BS} (\textit{Xgwm400} - \textit{Xgwm573}) accounted for 31, 16, 10 and 7\%, respectively, of the average phenotypic variation over three years \{10490\}.

Type I resistance and DON accumulation: Hobbit Sib/T. macha 4A DH population: Both traits were assigned to a small region distal to \textit{Xgwm601-4A} and cosegregating with \textit{Xgwm165-4A} \{10254\}.

DH181(R)(Sumai 3/HY 386 Seln.): QTL identified in 2DS, 3AS, 3BS, 3B Cent. region, 4DL, 5AS, 6BS \{10213\}.

Field resistance: Wuhan-1/Maringa, QTLs were located on chromosomes 2DS, 3BS (Proximal) and 4B \{10020\}.
Resistance to DON accumulation: Wuhan-1/Maringa, QTLs were located on chromosomes 2DL and 5DS {10020}.

Veery/CJ 9306 (R): Four QTLs contributed to resistance; *QFhs.ndsu-3BS* nearest marker *Xgwm533b* ($R^2 = 0.23$), *QFhs.nau-2DL, Xgwm539* ($R^2 = 0.2$), *QFhs.nau-1AS, Xbarc148* ($R^2 = 0.05$) and *QFhs.nau-5AS, Xgwm425* ($R^2 = 0.05$) {10496}. Haplotype diversity among a large number of FHB resistant and susceptible (mainly Canadian) germplasms indicated similarities in Asian, Brazilian and other materials {10173}. Brazilian cv. Maringa was more similar to Asian than to other Brazilian lines {10173}. For review see{0283}.

Mesterhazy et al. {0006} reported a strong genetic correlation in resistance to different species of *Fusarium*.

Bobwhite plants transformed with AtNPR1, an *Arabidopsis thaliana* gene that regulates activities of SAR, displayed a heritable type II response equal to that of Sumai 3 {10237}.

In cross Patterson (open)/Goldfield (closed) RILs, narrow flower opening which was correlated with FHB resistance. The major QTL effect associated with narrow flower opening and low FHB incidence occured in map interval *Xbarc200 - Xgwm210* (29% of variation in FHB incidence); these genes were probably located in chromosome 2BS {10243}.

Wangshuibai/Annong8455:RIL population: CIM analysis over 2 years detected QTL for FHB response on chromosome 3B ($R^2=0.17$) and 2A ($R^2=0.12$) and for DON levels in 5A ($R^2=0.13$), 2A ($R^2=0.85$) and 3B ($R^2=0.06$) {10447}. The regions involved were *Xgwm533-3B - Xbarc133-3B, Xgwm425-2A*, and *Xgwm186-5A - Xgwm156-5A* {10447}.

In a reciprocal backcross analysis of Chris monosomics/Frontana, Frontana chromosomes 3A, 6A and 4D reduced visibly diseased kernels, kernel weight and DON content, whereas Frontana chromosomes 2A, 2B, 4B and 7A increased the same traits {10398}.

Further study of the 3A, 6A and 4D reciprocal substitution lines indicated that chromosome 3A of Frontana had the largest effect on incidence, severity, spread and kernel damage, 4D less so and 6A possibly not at all {10900}. Soissons (relatively resistant)/Orvantis (susceptible): Soissons carried *QFhs.jic-4D* ($R^2=0.106-0.161$) associated with *Rht-D1a* (tall allele) {10718}. FHB susceptibility tended to be associated with the *Rht-D1b* allele {10718}. Supporting studies with NILs indicated that the presence of *Rht-B1b* led to reduced type 2 resistance relative to presence of *Rht-B1b* or the tallness alleles at both loci {10718}.

Ernie(I)/MO94-317(S):RIL population: 3 QTLs on chromosomes 3BSc, 4BL and 5AS accounted for 31 and 42% of the total phenotypic variances for DON and Fusarium damaged kernels (FDK), respectively. A minor QTL ($R^2=0.04$) for FDK was on chromosome 2B {10831}.

Six of 9 NIL pairs made by MAS for *Xgwm0181-3B* earlier located near a FCR QTL on 3BL.
Grandin(S)/PI277012(I): DH population: Two QTLs, \( Qfh.b.rwg-5A.1 \) on 5AS (\( R^2=0.06-0.2 \)) and \( Qfh.b.rwg-5A.2 \) on 5AL (\( R^2=0.12-0.2 \)) conferred type I and II resistance and reduced DON content \( \{0147\} \). The new QTL on 5AL was closely but not completely linked with gene \( q \) which is present in PI277012 \( \{10860\} \).

Nanda 2419 /Wangshuibai:

Backcross-derived NILs with \( Qfh.nau-2B, Qfhs.nau-3B, Qfhi.nau-4B \) (syn. \( Fhb4 \)), and \( Qfhi.nau-5A \) were developed with Mianyang 99-323 as the recurrent parent \( \{10884\} \).

Wheaton(I)/Haiyanzhong: RIL population: Four QTLs, \( Qfhb.uhlgl-7D \) [syn. \( Qhb.hyz-7D \)], nearest marker \( Xwmc121-7D, R^2=0.16-0.2 \), \( Qfhb.uhlgl-6B.1 \) [\( Qhb.hyz-6B.1 \), \( R^2=0.4 \)], \( Qfhb.uhlgl.6B.2 \) [\( Qhb.hyz-6B.2 \), \( R^2=0.07 \)], \( Qfhb.uhlgl-5A \) [\( Qhb.hyz-5A \), \( R^2=0.04-0.07 \)] were from Haiyanzhong, and \( Qfhb.uhlgl-1A \) [\( Qhb.hyz-1A \), \( R^2=0.05 \)] was from Wheaton \( \{10837\} \).

91.2. Disease: Crown rot caused by \( Fusarium pseudograminearum, F. culmorum \) and other \( Fusarium \) species.

QTL: Kukri(R)/Janz(S) DH population. Simple interval mapping in the region Pst1 ACG.Mse1CAC - Xgwm251-4B accounted for 48% of the variation in crown rot response \( \{10034\} \).

Lang (S)/CSCR6(R):RIL population: tested under controlled conditions with \( F. pseudograminearum \) and \( F. graminearum \): \( Qcrs.cpi-3BL \) from CSCR6, \( R^2=0.49 \) and \( Qcrs.cpi-4B \) from Lang \( R^2=0.23 \) \( \{10703\} \).

Six of 9 NIL pairs made by MAS for \( Xgwm01081-3B \) earlier located near the 3BL QTL \( \{10703\} \) in CSCR6 showed significant differences (\( P < 0.01 \)) in crown rot response \( \{10891\} \).

Sunco/2-49: DH population: Three QTLs for seedling resistance, viz. \( QCr.usq-1D.1 \) and \( QCr.usq-4B.1 \) (\( R^2=0.19 \)) from 2-49 and \( QCr.usq-2B.1 \) from Sunco \( \{10883\} \).

2-49/W21MMT70: DH lines: Three QTLs fo seedling resistance, viz. \( QCr.usq-1D.1 \), and a weaker QTL on chromosome 7A from 2-49 and \( QCr.usq-3B.1 \) (\( R^2=0.41 \)) from W22MMT70 \( \{10883\} \).

2-49 (partially Resistant) / Janz(susceptible) DH population: Analysis of partial seedling resistance indicated major QTL in chromosomes 1D (\( R^2=0.21 \)) and 1A (\( R^2=0.09 \)) and minor QTL in 2A, 2B (from Janz), 4B and 7B \( \{10132\} \).

W21NMT70/Mendos: DH population: three consistent QTLs for seedling resistance were identified with CIM; these were located in chromosome 5D and 2D (resistance alleles from W21NMT70) and 2B (resistance allele from Mendos) \( \{10358\} \).

Cansas / Ritmo: After \( QFHS.whs-5BL \) ’renamed \( Qfhs.lfl-1BL \) in \{10768\}’. \( Qfhs.lfl-1BL \) was verified in \( F_{4:7} \) lines and in detected Biscay, History and Pirat \{10768\}.

CS / CS(Sumai 3 7A): \( QFhb7AC \), nearest marker \( Xwmc17-7A \), explained 22% of phenotypic variance for Type II and 24% of phenotypic variance for Type III resistance \( \{10798\} \).

Lang / \( T. spelta \) CSCR6: \( Qcrs.cpi-3BL \) from CSCR6 was flanked by wPt8438 and wPt9495; \( R^2 \) up to 0.49, validated in other crosses \( \{10723\} \). \( Qcrs.cpi-4B \) from Lang; \( R^2 \) up to 0.23 \( \{10723\} \).
Soissons (relatively resistant) / Orvantis (susceptible): Increased susceptibility associated with the Rht-D1b allele was further confirmed in crosses of semi-dwarf cultivars Apachi, History and Romanus {10793}.

92. Reaction to *Heterodera avenae* Woll.

Cereal root eelworm; cereal cyst nematode.

**Cre1.** [Cre1{1388}]. 2B{1388}.2BL{1579,1580}. i: AP = Prins*8/AUS10894{1579}. v: AUS 10894{1056}; Beulah{10013}; Chara{10163}; Goldmark{10013}; Goroke{10013}; Kellalac{10013}; Loros CI 3779{10013}; Mira{10163}; Mitre{10163}; Ouyen{10013}; RE8670{10013}; Silverstar{10013}; VI252{10013}; VI727{10013}. ma: Xglk605-2B - 7.3 cM - Cre1 - 8.4 cM - Xcdo588-2B/Xabc451-2B{1579}; A PCR-based assay was developed from Xglk605-2B{1580}; Co-segregation with Xcsl107-2B{1579}; Four of 6 land varieties possessed Xcsl107-2B{1580}. QTL: Four QTLs for resistance to Mycosphaerella graminicola were identified in replicated field experiments in a double haploid population from Savannah (susceptible)/Senat(resistant). Senat contributed all the alleles providing resistance {10067}.

**QStb.riso-2B** was mapped on chromosome arm 2BL linked to SSR marker Xwmc175-2B (LOD>5, R²>17%) {10067}.

**QStb.riso-3A.2** was mapped on chromosome arm 3AS linked to SSR markers Xwmc489-3A, Xwmc388-3A and Xwmc505-3A (LOD>4, R²>18%). Also detected at the seedling stage {10067}. Xgwm369-3A is present on chromosome arm 3AS {0187}. A resistance gene from Senat located at or near the Stb6 locus was mapped 5 cM from microsatellite Xgwm369-3A on chromosome arm 3AS {10067}.

**QStb.riso-6B** was mapped on the centromeric region between SSR markers Xwmc494-6B and Xwmc341-6B (LOD>16, R²>68%). Also detected at the seedling stage {10067}.

**QStb.riso-7B** was mapped on chromosome 7B close to SSR marker Xwmc517-7B (LOD>4, R²>11%) {10067}.

ITMI Population: Three QTL, **QStb.ipk-1DS, QStb.ipk-2DS** and **QStb.ipk-6DS** conferred seedling-stage resistance to 2 isolates, whereas 2 QTL **QStb.ipk-3DL** and **QStb.ipk-7BL** conferred separate adult-stage resistances to each isolate {10151}.

A weak QTL, **QStb.psr-7D.1**, giving partial resistance to Portuguese isolate IPO92006, was detected in the Xcdo475b-7B - Xswm5-7B region in chromosome 7DS {10341}.
Apache/Balance: Analyses with a panel of *M. graminicola* cultures identified QTLs on chromosomes 1BS (Apache, considered to be *Stb11*), 3AS (Balance, considered to be *Stb6*), 6DS (Balance, named as *Stb18*), 7DS (Apache, considered to be *Stb4*) and 7DL (Apache) \{10827\}.

Florett/Biscay(S): RIL population: two QTLs for APR were located on chromosomes 3B and 6D \{10901\}.

Tuareg/Biscay(S): RIL population: two QTLs for APR were located on chromosomes 4B and 6B \{10901\}.

Disease: Septoria nodorum blotch, Stagonospra nodorum blotch.

97.1. Genes for resistance

- **Snb1** \{856\}. 3AL\{856\}. v: Red Chief\{856\}. v2: EE8 Snb2\{856\}.
- **Snb2** \{856\}. 2AL\{856\}. v2: EE8 Snb1\{856\}.
- **Snb3** \{1594\}. 5DL\{1594\}. s: CS\*/Synthetic 5D\{1594\}. v: Synthetic\{1594\}. dv: *Ae. tauschii*\{1594\}.
- **SnbTM** \{856,857\}. 3A\{856\}.3AL\{856\}. v: Cooker\{10210\}; Hadden\{10210\}; Missouri\{10210\}; Red Chief\{10210\}; 811WWMN 2095\{10210\}; 86ISMN 2137\{10210\}. tv: *T. timopheevii* /2 Wakooma\{856\}; *T. timopheevii* PI 290518. *T. timopheevii* derivatives: S3-6\{857\}; S9-10\{857\}; S12-1\{857\}. ma: *UBC521650* - 15 cM - *SnbTM* - 13.1 cM - *RC37510*\{0212\}.

*UBC521650* was converted to a SCAR marker\{0212\}.

Allelism of the hexaploid wheat gene and the *T. timopheevii SnbTM* was suspected but not confirmed.

QTL

A QTL analysis of SNB response in the ITMI population found significant effects associated with chromosome 1B (probably *Snn1*) and 4BL, with an interactive effect involving the 1BS region and a marker on chromosome 2B \{10009\}. An additional QTL on 7BL was effective at a later stage of disease development \{10009\}.

Four QTLs, on chromosomes 2B (proximal part of long arm), 3B (distal part of short arm), 5B and 5D, were mapped in a Liiwilla / Begra doubled haploid population. Longer incubation period and lower disease intensity were contributed by Liiwilla \{10045\}.

Two QTLs for glume blotch resistance under natural infection were identified on chromosomes 3BS and 4BL in Arina / Forno RILs \{10065\}. The 3BL QTL, designated *QSng.sfr-3BS*, was associated with marker *Xgwm389-3B* and explained 31.2% of the variation. The resistance was contributed by Arina \{10065\}. The 4BL QTL, *QSng.sfr-4BL*, was associated with *Xgwm251-4B* and explained 19.1% of the variation. Resistance was contributed by Forno \{10065\}. A QTL on 5BL, *QSng.sfr-5BL*, overlapped with QTLs for plant height and heading time \{10065\}. *QSng.sfr-3BS* peaked 0.6 cm proximal to *Xsun2-3B* \{10465\}. Association mapping involving 44 modern European cultivars indicated that the association was retained in a significant proportion of genotypes \{10465\}.
A QTL, *QSnl.ihar-6AL*, identified in DH lines of Alba (R) / Begra (S) accounted for 36% of the phenotypic variance in disease severity and 14% of the variance in incubation period \{10143\}.

Forno (S) / Oberkulmer spelt (R). Among 204 RILs leaf and glume response were genetically different but correlated (R^2=0.52). Ten QTLs for glume blotch (SNG) resistance were detected, 6 from Forno. A major QTL (R^2=35.8%) was associated with q. Eleven QTLs (4 from Forno) affected leaf blotch; 3 of these (chromosome 3D, 4B and 7B) with R^2>13% were considered potential candidates for MAS \{10250\}.

ITMI population: A major QTL, coinciding with *Snn1*, was located in chromosome 1BS (R^2 = 0.58, 5 days after inoculation), minor QTL were found in 3AS, 3DL, 4AL, 4BL, 5DL, 6AL and 7BL \{10009\}.

Br34 / Grandin: Three QTLs with resistance effects from BR34; *Qsnb.fcu-5BL.1 (Tsn1)*, R^2 = 0.63, *Qsnb.fcu5BL.2*, R^2 = 0.06, and *Qsnb.fcu-1BS* (vicinity of *Snn1*), R^2 = 0.10 \{10458\}. QTL analysis of the RIL population with Culture Sn6 revealed four QTLs, *Qsnb.fcu-2DS* (R^2 = 0.3 - 0.49) associated with *Snn2*, *Qsnb.fcu-5BL* (R^2 = 0.14 - 0.2) associated with *Tsn1*, *Qsnb.fcu-5AL* (R^2 = 0 - 0.13) associated with *Xfcp13-5A*, and *Qsnb.fcu-1BS* (R^2 = 0 - 0.11) associated with *Xgdm125-1BS* \{10507\}.

P91193D1 (partially resistant) / P92201D5 (partially resistant) RIL populations were tested in Indiana and Western Australia for glume resistance. Two QTL were identified: *Qng.pur-2DL.1* from P91193D1 (R^2 = 12.3 in Indiana and 38.1% in WA, respectively; *Xgwm526.1-2D - Xcfd50.2-2D*) and *QSng.pur-2DL.2* from P99201D5 (R^2 = 6.9% and 11.2%, respectively; *Xcfd50.3-2D - wPT9848*) \{10471\}.

HRWSN125(R)/WAWHT2074(S): Constant detection of *QSnl.daw-2DL* for flag leaf resistance, and *QSng.daw-4BL* for glume resistance over two years \{10584\}.

### Tetraploid wheat

Langdon/Langdon (*T. turgidum* ssp. *dicoccoides* Israel-A 5B): *QSnb.ndsu-5B* located 8.3 cM proximal to *tsn1* for tan spot resistance; R^2 = 0.38 \{10597\}.

A summary of QTL analyses is provided in \{10726\}.

Salamouni/Katepwa: RIL population: Two QTLs, *Qsnb.fcu-1A (Snn4)* (R^2=0.24) and *Qsnb.fcu-7A* (R^2=0.16) were associated with SNB response to isolate Sn99CH 1A7a \{10867\}.

#### 97.2. Sensitivity to SNB toxin

A discussion on the origin and role of host-specific toxins is provided in \{10726\}.

Australian cultivars with *Tsn1* and *tsn1* are listed in \{10540\}.

### Tetraploid wheat

In a reevaluation of this work Faris and Friesen \{10688\} attributed all of the variation in SNB response to the presence or absence of SnTox1.

**Yr48** {10705}. Adult plant resistance. **[Qyr.ucw-5AL]** {10705}. 5AL {10705}. **bin**: 5AL23 0.87-1.00. **v**: UC1110 (S)/PI 610750 RIL 4 = GSTR 13504 & RIL167 = GSTR 136 {10705}. **ma**: Co-segregated with Vrn2, Be495011, Xcfa2149-5AL, Xgpw2181a-5AL, Xwmc74-5AL, and Xwmc727-5AL - 3.7 cM - Vrn-A2 - 0.1 cM - Yr48/BE444566-5AL/Xcfa2149-5AL/Xgpw2181a-5AL/Xwmc410-5AL {10705}. PI 610750 = Synthetic 205 (Crop 1 / *Ae. tauschii*) {10705}.

Sources of additional genes for seedling (designated "12") and adult resistances ("13", "14", "15") are listed in {1430}.

Genotype list: Chinese common wheats {10369}. European wheats {10579}. U.K. wheats {10697}.

### 100.2. Temporarily designated genes for resistance to stripe rust

North American workers {181,186,184} allocated a number of temporary designations to uncatalogued genes detected with North American *P. striiformis* accessions. Druchamp, Yamhill and Stephens were reported to carry 'Yr3a or Yr4a" because these genes could not be distinguished with the cultures that were used.

**Yr4**. Refers to a phenotype specificity that appears to be controlled by complementary genes {1563}. **v**: Avocet* {\* = heterogeneous}; Anza = Karamu = Mexicani = T4 = WW15; Banks; Condor; Cocamba; Egret; Inia 66; Lerma Rojo 64; Lerma Rojo 64A; Nainari 60; Nuri 70; Sanda 73; Sonalika; Zaminder 80. **v2**: Condor selection P44 Yr6; Pari 73 Yr6; Saric 70 Yr6; Yecora 70 Yr6 {1563}.

**YrAlp** {10416}. 1BS {10416}. **v2**: Alpowa Yr39 {10416}. **ma**: YrAlp - 15.2 cM - Xgwm18-1B - 1.1 cM - Xgwm11-1B {10416}; and more closely linked to RGAP markers {10416}.

100.3. Stripe rust QTLs

Two QTLs in Camp Remy/Michigan Amber were located on chromosome 2BL (QYRI, LOD score 12) and 2AL (QYR2, LOD 2.2) {0287}. Four QTLs were scored in the ITMI population. The most effective (QYR3, LOD 7.4) on chromosome 2BS was probably _Yr27_, the others were located in 7DS (QYR4, LOD 3.4), 5A (QYR5, LOD 2.8), 3D (QYR6, LOD 2.8) and 6DL(QYR7, LOD 2.4) {0287}.

Camp Remy/Recital: 217 RILs. Six QTLs for APR were detected over 4 years. _QYr.inra-2BL_ (R²=0.42-0.61) corresponded largely to seedling resistance gene _Rsp_ and possibly _Yr7_. The other genes were _Qyr.inra-2AL_, _QYr.inra-2BL_, _QYr.inra-2DS_ (perhaps _Yr16_), _QYr.inra-5BL.1_ and _QYr.inra-5BL.2_ {10279}.

Seven QTLs were identified for stripe rust severity in a joint analysis of five datasets from a Fukuhokomugi/Oligoculm doubled haploid population {10060}. Their location, associated marker, percentage variation explained, and genotype contributing to enhanced resistance at that locus, are listed below.

3BS; _Xgwm389-3B_; 0.2-4.9%; Oligoculm {10060}.
4BL; _Xgwm538-4B_; 1.8-12.3%; Oligoculm {10060}.
4DL; _Xwmc399-4D_; 2.5-8.0%; Oligoculm {10060}.
5BL; _Xwmc415-5B_; 2.4-16.1%; Oligoculm {10060}.
6BS(centromeric); _Xgwm935-6B_; 0.5-3.8%; Oligoculm {10060}.
7BS; _Xgwm935-7B_; 1-5.2%; Oligoculm {10060}.
7DS; _Xgwm295-7D_; 10.7-23.7%; Fukuhno {10060}; the 7DS QTL was probably _Yr18_ {10060}.

Four QTLs were identified for stripe rust infection in a joint analysis of three datasets from a Fukuhokomugi/Oligoculm doubled haploid population {10060}. Their location, associated marker, percentage variation explained and parent contributing to enhanced resistance at that locus are listed below.

2DL; _Xgwm349-2D_; 6.5-9.6%; Fukuhno {10060}.
3BS; _Xgwm389-3B_; 15.1-24.5%; Oligoculm{10060}.  The 3BS QTL may be _Yr30_ {10060}.
5BL; _Xwmc415-5B_; 6.4-12.7%; Oligoculm {10060}.
Otane (R)/Tiritea (S) DH population: QTL in 7DS (probably \textit{Yr18}), 5DL (from Otane) and 7BL (Tiritea) \{10150\}. Interval mapping of 7DS indicated that the presumed \textit{Yr18} was 7 cM from \textit{Xgwm447D} \{10150\}.

Kariega/Avocet S DH population: Two QTLs \textit{QYr.sgi-7D} (probably \textit{Yr18}) and \textit{QYr.sgi.2B.1} accounted for 29 and 30\%, respectively, of the phenotypic variation for stripe rust response. The nearest marker to the latter was \textit{Xgwm1482B} \{10184\}.

Four QTLs were detected in a multiple cross analysis \{10283\}: Chromosome 2AL (probably \textit{Yr32} in Deben, Kris and Soloist), 2AS (probably \textit{Yr17} in Kris), 2BL (\textit{Xwmc1492B} - \textit{Xwmc317a2B} in Deben) and 6BL (\textit{Xwmc3976B} - \textit{Xwmc105b6B} in Soloist and Kris).

Avocet S/Pavon 76: QTL identified in 1BL (\textit{Xgwm259}), 3BS (\textit{PstAATMseCAC2}), 4BL (\textit{Xgwm495}), 6AL (\textit{Xgwm617}), 6BL (\textit{PstAAGGMseCGA1}) \{10443\}.

\textit{T. monococcum} PAU14087 (resistant)/\textit{T. boeoticum} PAU5088 (resistant): RIL population: One adult plant resistance QTL identified in each parent and named \textit{QYrtm.pau-2A} (in a 3.6 cM interval between \textit{Xwmc4072A} and \textit{Xwmc1702A}; $R^2 = 0.14$) and \textit{QYrtb.pau-5A} (in a 8.9 cM interval between \textit{Xbarc1515A} and \textit{Xcfd125A}; $R^2 = 0.24$) \{10518\}.

Luke (R)/Aquileja (R): Two QTLs for high-temperature adult plant resistance, \textit{QYRlu.cau-2BS.1} (distal, flanked by \textit{Xwmc1542B} and \textit{Xgwm1482B}, $R^2 = 0.366$) and \textit{QYRlu.cau-2BS.2} (proximal, flanked by \textit{Xgwm1482B} and \textit{Xbarc1672B}, $R^2 = 0.415$) from Luke, and \textit{QYRaq.cau-2BL} (flanked by \textit{Xwmc1752B} and \textit{Xwmc3322B}, $R^2 = 0.615$) in Aquileja for stripe number \{10582\}.

Acocet S/Attila: QTLs were located on chromosomes 2BS (probably \textit{Yr27}), 2BL (a race-specific effect) and 7BL (\textit{XP32M59} - \textit{Xgwm3447B} \{10586\}).

Guardian / Avocet S: F3 lines. One major QTL, \textit{QPst.jic-1BL} (\textit{Xgwm8181} - \textit{Xgwm2591B}, $R^2$ up to 0.45), and two minor resistance QTLs on chromosomes 2D and 4B originating from Guardian \{10589\}. The major QTL was in the region of \textit{Yr29}.

Stephens / Michigan Amber: Two QTLs for high temperature APR were located in chromosome 6BS; \textit{QYrst.wgp-6BS.1} located in a 3.9 cM region flanked by \textit{Xbarc1016B} and \textit{Xbarc1366B} and \textit{QYrst.wgp-6BS.2} located in a 17.5 cM region flanked by \textit{Xgwm1326B} and \textit{Xgdm1136B} \{10602\}.

Pingyuan 50 (R)/Mingxian 169 (S): DH population: APR: \textit{QYrcaas-2BS} (\textit{Xbarc132BS} - \textit{Xbarc2302BS}, $R^2=0.05-0.09$), \textit{QYr.caas-5AL}(\textit{Xwmc4105AL} - \textit{Xbarc2615AL}, $R^2=0.05-0.2$), \textit{QYrcaas-6BS}(\textit{Xgwm3616BS} - \textit{Xbarc1366BS}, $R^2=0.05-0.08$) \{10693\}.

Renan (R)/Recital (S) RIL population: Tested for AUDPC in 1995/6 and 2005/6 with pathogen isolates avirulent and virulent, respectively, for \textit{Yr17}: \textit{QYr.inra-2AS.2}, (=\textit{Yr17}), $R^2=0.45$, 1995/6; \textit{QYr.inra-2AS.1}, $R^2=0.9$, 2005/6; \textit{QYr.inra-2BS}, $R^2=0.11$ & 0.13, \textit{QYr.inra-3Bcent}, $R^2=0.06$ in 2005/6; \textit{QYr.inra-6B}, $R^2=0.04$ & 0.06; from Renan; and \textit{QYr.inra-2AS.1}, $R^2=0.09$; \textit{QYr.inra-3DS}, $R^2=0.08$ & 0.12 from Recital. Other QTLs were effective only at certain growth stages \{10689\}.

\textbf{PATHOGENIC DISEASE/PEST REACTION}
PATHOGENIC DISEASE/PEST REACTION

Express / Avocet S: RIL population: Relative AUDPC for high temperature APR was controlled by QYrex.wgp-6AS, R²=0.326, interval Xgwm334-6A - Xgwp56-6A; QYrex.wgp-3BS, R²=0.274, interval Xgwm299-3B - Xwgp66-3B, QYrex.wgp.1BL, R²=0.094, interval Xwmc631-1B - Xwgp78-1B {10672}. When rust phenotyping was based on infection type only the 6S and 3BL QTLs were evident {10672}.

Alcedo (R) / Brigadier (S): DH population: Two major QTLs QPst.jic-2DL (R² up to 0.36) and QPst.jic-4BL (R² up to 0.29) for percent infection contributed be Alcedo {10785}. A seedling-expressed QTL was located at the same position in 2DL {10774}.

Flinor (R) / Mingxian 169 (S): Two independent QTLs for high temperature (24/18C) seedling resistance located in chromosome 5BL, designated QYr-tem-5B.1 (Xbarc89 - Xgwm67) and QYr-tem-5B.2 (Xbarc140n - Xwmc235) and R² = 0.37 and 0.33, respectively {10797}.

Kukri (MR) / Janz (MR): DH population: Tested with pre- and post-2003 Australian Pst races in several environments. QYr.sun-7B (Kukri) and Qyr.sun-7D (=Yr18) (Janz) were consistent over environments; QYr.sun-1B, -5B and -6B were detected in most environments and QYr.sun-3B was identified in only one season. Two genes, QYR.sun-1A from Janz and QYr.sun-2A from Kukri, were detected only with pre- and post-2003 races, respectively, and likely contributed to differential responses of these cultivars to the two groups of races {10751}.

Pioneer 26R61(R)/AGS2000(S): RIL population: Two QTLs, QYr.uga-2AS (R²=0.56) flanked by Xbarc124-2A and Xgwm359-2A (also named YrR61) and QYr.uga-6AS (R²=0.06) {10914}. Minor QTLs were also on other chromosomes.

UC1110(MR)/PI 610750(MR): RIL population: QYr.ucw-3BS ex UC1110, R²=0.22, associated with Xgwm522-3B.1. This marker differs from Xgwm533-3B.2 that is associated with Yr30 {10705}; QYr.ucw-5AL, R²=0.1, ex PI 61075 - syn. Yr48 {10705}; QYr.ucw-2BS, R²=0.045, ex UC1110, located in the centromeric region near Xwmc474-2BS {10705}, Qyr.ucw-2AS, R²=0.023, ex PI 61725, near wPt-5839 {10705}.

Stephens I/Platte(S): RIL population: 13 QTLs were identified across several environments; significant QTL x environment interactions suggested that plant stage specificity, pathogen genotype and temperature as well as host genotype were important in determining rust response {10890}.

101. Reaction to Puccinia triticina
Disease: Brown rust, leaf rust.

101.1. Genes for resistance
Lr1{047}. 1B{1409}.5D{954}.5DL{945}. i: Centenario/6*Thatcher{317}; Malakoff/6 Prelude{317}; Wichita*4/Malakoff{613}. v: Line 87E03-S2B1{10561}; Centenario{317}; Chicora ‘S’{143}; Daws (heterogeneous){1019}; Dirkwin{1019}; Glenlea{1255,976}; Halle 9H37{074}; Hyslop{1019}; Luke {heterogeneous}{1019}; Malakoff{047}; McDermid{1019}; Mexico 120[933]; Newton{143,1024,1023}; Norco{1019}; Shabati Sonora{842}; Sonora 64{842}; Tarsa{842}; Uruguay{954}; Walliday{1019}. v2: Blueboy Lr10{143}; Blueboy II Lr10 Lr24{143}; Erythrospermum 142 and 953 Lr3{074}; Laura Lr10 Lr34{712}; Norka Lr20{1552}; Plainsman V Lr3{1024}; Suneca Lr13{485}. dv: Several Ae. tauschii accessions{10191}. ma: Co-seg. with Xpsr567-5D and Xglk621-5D in a Frisal/Lr1 resistant line. pTAG621 was converted to a
diagnostic STS\{354\}; Terminally located\{10189\}; In Ae. tauschii recombination in the region was 5-10X that in common wheat, gene order $Xprs567-5D$ - $Lr1$ - $Xabc718-5D$\{10191\}; Mapped to a 0.7 cM interval in Ae. tauschii and a 0.075 cM interval in wheat\{10408\}; A candidate gene for $Lr1$, $Lr1RGA1$, encoding a CC-NBS-LRR protein, cosegregated with $Lr1$\{10408\}; Co-segregation with RGA567-5-10561.  

$c$: $Lr1$ is a member of a multigene family (PSR567), has a CC-NBS-LRR structure, and produces a protein of 1,344 aa, EF567063\{10561\}.

$Lr2$.  1B\{1409\}.2DS\{843,942\}.

$Lr2a$\{320\}.  \[Lr2\{047\}.\]  $i$: Prelude\{6/Webster\{320\}; Red Bobs\{6/Webster\{320\}; Webster\{6/Thatcher\{306\}; Wichita\{4/Webster\{613\}.  v:  Eureka CI 17738\{143\}; Festiguay\{843\}; Webster\{047\}.  \[v2:\] Alex $Lr10\{976\}$; Ck 9835 $Lr9\{10146\}$; Ck 9663 $Lr2$ $Lr10\{10146\}$; Guard $Lr10\{976\}$; James $Lr10\{976\}$; Len $Lr10\{976\}$; Marshall $Lr10\{976\}$; Mediterranean W1728 $Lr3\{1369\}$; Shield $Lr3$ $Lr10\{198\}$; Waldron $Lr10\{143\}$.

Lrk10. A receptor-like kinase. The locus Xsfr1(Lrk10)-1A, detected by the probe Lrk10, is completely linked with Lr10 in chromosome 1AS {356}. The gene encodes a receptor-like kinase with extracellular and kinase domains {0297}. Using probe pLrk10-A, developed from the extracellular domain, 6 homologues were found in chromosomes 1A (1), 1B (3) and 1D (2) as well as group 1 chromosomes of T. monococcum, Ae. tauschii and barley {0296,0294}. Probes based on the kinase domain identified further homologues in chromosomes 3AS and 3BS as well as the corresponding regions in rice and maize {0294}. Both orthologous and paralogous evolution were suggested.

### 101.3. QTLs for reaction to *P. triticina*

Two QTLs, located distally on chromosome arm 1BL and on chromosome 7DS, were mapped for leaf rust severity in a Fukuho-komugi/Oligoculm doubled haploid population {10060}. The resistance on 1BL was contributed by Oligoculm and explained 15% of the variation. The 1BL QTL may correspond to *Lr46* and was associated with marker *Xwmc44-1B* {0460}. The resistance on 7DS was contributed by Fukuho-komugi and explained 41% of the variation. The 7DS QTL corresponds to *Lr34* and was associated with marker *Xgwm295-7D* {10060}.

Two major QTL, located on chromosomes 7D and 1BS, for leaf rust resistance were mapped in an Arina/Forno RIL population {10066}. The resistance on 7D was contributed by Forno and explained 32% of the variation. This QTL most likely corresponds to *Lr34* {10066}. The resistance on 1BS (*QLr.sfr-1BS*) was associated with *Xgwm604-1B* and was contributed by Forno {10066}. Additional minor QTLs were identified on chromosome arms 2DL, 3DL, 4BS and 5AL {10066}.

QTLs for leaf rust resistance were identified in {0050} and were named by the catalogue curators as follows:

- **QLr.pser.1BL**{10743}. 1BL{10743}. **bin**: 1BL6-0.32{10743}. **ma**: Proximal to *Xgwm264.1-1BL*{10743}. Associated with *lm* producing a lesion mimic phenotype in the absence of disease {10743}.

- **QLr.sfr-1B**{0050}. 1BS{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Forno{0050}. **ma**: Associated with *Xpsr949-1B* and *Xgwm18-1B*{0050}.

- **QLr.sfr-2B**{0050}. 2B{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Oberkulmer{0050}. **ma**: Associated with *Xpsr924-2B* and *Xglk699-2B*{0050}.

- **QLr.sfr-3A**{0050}. 3A{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Forno{0050}. **ma**: Associated with *Xpsr570-3A* and *Xpsr543-3A*{0050}.

- **QLr.sfr-4B**{0050}. 4B{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Forno{0050}. **ma**: Associated with *Xpsr921-4B* and *Xpsr593-4B*{0050}.

- **QLr.sfr-4D**{0050}. 4DL{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Forno{0050}. **ma**: Associated with *Xgk302-4D* and *Xpsr1101-4D*{0050}.

- **QLr.sfr-5D**{0050}. 5DL{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Oberkulmer{0050}. **ma**: Associated with *Xpsr906-5D* and *Xpsr580-5D*{0050}.

- **QLr.sfr-7B.1**{0050}. 7B{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Forno{0050}. **ma**: Associated with *Xpsr593-7B* and *Xpsr129-7B*{0050}.

- **QLr.sfr-7B.2**{0050}. **v**: Forno/T. spelta cv. Oberkulmer mapping population; the resistance was contributed by Forno{0050}. **ma**: Associated with *Xglk750-7B* and *Xmwg710-7B*{0050}.
QTLs: Two QTLs for slow leaf rusting, located on chromosomes 2B and 7BL, were mapped for final severity, area under disease progress curve, and infection rate in a CI 13227 (resistant)/Suwon (susceptible) SSD population {10211}. \textit{QLr.osu-2B} was associated with microsatellite markers \textit{Xbrc18-2B} and \textit{Xbrc167-2B} ($R^2 = 9-18\%$). \textit{QLr.osu-7BL} was associated with microsatellite marker \textit{Xbrc182-7B} ($R^2 = 12-15\%$) {10211}. CI 13227 contributed the resistant alleles for both QTLs. \textit{QLridd.ouc-2D}, linked to \textit{Xgwm261-2D}, affected the duration of infection {10211}.

Avocet S/Pavon 76: QTL identified included: 1BL (PstAFAMseCAC1&2), 4BL (Xgwm368), 6AL (Xgwm617), 6BL (PstAGGMseCGA1) {10443}.

Avocet S/Attilla: At least two additive genes for slow rusting {10586}. In addition to \textit{Lr46} there were small effects on chromosomes 2BS, 2BL and 7BL {10586}.

TA 4152-60 (MR) / ND495 (MR): DH population: Five QTLs for APR were identified in the field, viz \textit{QLr.fcu-3AL} ($R^2 = 0.18$), \textit{QLr.fcu-3BL} ($R^2 = 0.19$), \textit{QLr.fcu-5BL} ($R = 0.07$), and \textit{QLr.fcu-6BL} ($R^2 = 0.12$) from TA 4152-60 and \textit{QLr.fcu-4DL} ($R^2 = 0.13$) from ND495 {10757}. The 3AL gene also conferred seedling resistance to some races and the 3BL gene conferred resistance to race MFPS {10757}.

Tetraploid wheat

Colosseo/Lloyd: A major QTL, \textit{QLr.ubo-7B.2}, for seedling and adult plant resistance from Colosseo, was located between \textit{Xgwm344.2-7B} and DART 378059, bin 7BL 10-0.78-1.00 {10600}.

TA4152-60/ND 495 DH population: Four QTLs for APR, \textit{QLr.fcu-3AL(Xcfa2183-3AL - Xgwm666-3AL, R^2=0.18)}, \textit{QLr.fcu-3BL(Xbarc164-3BL - Xfcp544-3BL, R^2=0.19)}, \textit{QLr.fcu5BL}, and \textit{QLr.fcu-6BL(Xbarc5-6BL - Xgwm469.2-6BL, R^2=0.12)} were from TA4152-60 and \textit{Xlr.fcu-4DL(Xgdm61-4DL - Xcfa2173-4DL, R^2=0.13)} was from ND495 {10717}. The 3AL QTL conferred seedling resistance to all 3 races, and the 3BL gene gave race-specific seedling resistance to one race. \textit{Xlr.fcu-3BL} was effective only in the presence of an allele associated with \textit{Xgwm359-5DS} {10717}.

Association mapping indicated genomic regions affecting leaf rust response in chromosomes 1A, 1B, 2A, 2B (\textit{Lr13, Lr23} region), 3B, 5A, 5B, 6B, 7A, and 7B (see \textit{Lr14} {10736}).

102. Reaction to \textit{Pyrenophora tritici-repentis} (anomorph: \textit{Drechlera tritici-repentis})

Disease: Tan spot, yellow leaf spot.

Virulence in the pathogen is mediated by host-specific toxins and host resistance is characterized at least in part by insensitivity to those toxins. Three toxins, \textit{Ptr ToxA}, \textit{Ptr ToxB} and \textit{Ptr ToxC} have been identified (see {10153}). Toxin sensitivity determined by use of toxins extracted from pathogen strains and resistance determined by infection experiments are treated as different traits, although common genes may be involved.

A review is provided in {10690}.

102.1. Insensitivity to tan spot toxin (necrosis)

\textit{tsn1} {346,10207}. Insensitivity (disease resistance) is recessive {346}. \textit{Tsr1} {10508}, see Resistance to tanspot. 5BL{346}. \textbf{v}: AC Barrie{10153}; AC Cadillac{10153}; AC Elsa{10153}; Atlas 66{10458}; BR34{0007,10458}; CEP17{0007}; Chinese Spring{0007,10458}; Erik{0007,10030,10458}; IA807{0007}; IA905{0007}; Laura{10153}; ND688{10458}; Opata 85{10458}; Synthetic W-7976 = Cando/R143/Mexicali 'S'/3/Ae. squarrosa C122{346,10207,10458}; Synthetic W-7984 =
Altar 84/Ae. tauschii CI 18{10007,10458}. **tv:** Altar 84{10007}; D87450{10007}; *T. dicoccoides* Israel A{10506}. **ma:** Xbcd1030-5B - 5.7 cM - tsn1 - 16.5 cM - Xwg583-5B{10458}; tsn1 - 3.7 cM - Xbcd1030-5B{10007}; Xfjcg7-5B - 0.4 cM - Tsn1/Xfjcg17-5B - 0.2 cM - Xfjcg9-5B{10207}; Xfjcg17-5B - 0.2 cM - Tsn1 - 0.6 cM - Xfjcg9-5B{10207}; Xfcp1-5B and Xfcp2-5B delineated Tsn1 to an interval of about 1 cM{10337}; Tsn1 was placed in a 2.1 cM region spanned by XBF483506 and XBF138151.1/XBE425878/Xfcc1/XBE443610{10413}. According to {10376} the same dominant allele, presumably tsn1, conferred resistance to chlorosis induced by races 1 and 3 in cultivars Erik, Hadden, Red Chief, Glenlea and 86ISMN 2137 in crosses with 6B-365.

**Tsn1.** Sensitive to *Ptr* ToxA. **v:** Bobwhite{10458}; Cheyenne{0007,10458}; Glenlea{10458}; Grandin{10458}; Hope{0007,10458}; Jagger{0007}; Katepwa{10458}; ND2709{10458}; ND495{0007}; Sumai 3{10458}; Timstein{0007,10458}. **v2:** Kulm Tsc1{346,10030,10458}; Trenton Tsc1{0315}. **dv:** Two *Ae. speltoides* accessions{10756}. **tv:** Langdon{10458}; Some *T. dicoccoides* accessions{10756}. **c:** Tsn1 has 8 exons and a S/TPK-NBS-LRR structure; all three domains are required for function and TSN1 protein does not interact directly with ToxA{10756}. In Kulm/Erik, toxin response accounted for 24% of the variation in disease response, which was affected by 4-5 genes{10030}.

*Ptr* ToxA is functionally identical to *S. nodorum* ToxA but has two predicted amino acid differences{10459}. See Reaction to *Phaeosphaeria nodorum*. Australian cultivars with tsn1 and Tsn1 are listed in{10540}.

**Tsn2{10344}**. Conditions resistance to race 3 {10344} 3BL{10344}. **sutv:** LDN(DIC-3B){10344}. **tv:** T. turgidum no. 283, PI 352519{10344}; *T. dicoccoides* Israel-A{10344}. **ma:** Identified as a QTL in region Xgwm285-3B - Xwmc366.2-3B (R²=91%){10344}; Also classified as a single gene: Xgwm285-3B - 2.1 cM - tsn2 - 15.2 cM - Xwmc366.2-3B{10344}.

In Kulm/Erik, toxin response accounted for 24% of the variation in disease response, which was affected by 4-5 genes{10300}.

102.2. Insensitivity to tan spot toxin (chlorosis) **Tsc1{344}**. Sensitivity to *Ptr* ToxC {344}. 1AS{344}. **v:** 6B365{0315}; Opata 85{344}. **v2:** Kulm Tsn1{0315}; Trenton Tsn1{0315}. **ma:** Gli-A1 - 5.7 cM - Tsc1 - 11.7 cM - XksuD14-1A{0315}. According to {10376} the same allele, presumably tsc1, conferred resistance to chlorosis induced by races 1 and 3 in cultivars Erik, Hadden, Red Chief, Glenlea and 86ISMN2137 in crosses with 6B-365.

**Tsc2**{10015}. Sensitive to *Ptr* ToxB{10015}. 2BS {10015}. **bin:** 2BS3 0.84-1.00. **v:** Katepwa{10871}; Synthetic W-7984{0315}. **tsc2**. Insensitivity allele {10015} **v:** Opata 85{0315, 10015}; Salamouni{10871}. **tv:** Altar 84{10871}. **ma:** Xmag681-2B/XTC339813 - 2.7 cM - Tsc/XBE444541 - 0.6 cM - XBE517745{10871}; An XBE444541 EST-STS co-segregating marker for Tsc2 was developed and lines with tsc2 produced a 505 bp fragment whereas those with Tsc2 produced a 340 bp band{10871}.

**QTsc.ndsu-1A**{9924}. Resistance is likely recessive {344}. **v:** Katepwa{0315}; Opata 85{344}; Synthetic W-7984{0315}. **ma:** Association with Gli-A1{344,0040,0264}. **QTsc.ndsu-1A** or a closely associated gene, confers insensitivity to *Ptr* ToxC, see {0315}. Inoculation with purified toxin *Ptr* ToxC was used to map this locus. **QTsc.ndsu-1A** confers resistance in both seedlings and adult plants.
**QTsc.ndsu-4A.** 4AL\{0090\}.  v: Opata 85/Synthetic W-7984 (ITMI) RI mapping population; resistance was contributed by W-7984\{0090\}; In W-7976/Trenton resistance was contributed by W-7976{0264}.  ma: Association with Xksu916(Oxo2)-4A and Xksu915(14-3-3a)-4A\{0090\}; In W-7976/Trenton there was association with Xw622-4A{0264}; Minor QTLs in chromosomes 1AL, 7DS, 5AL and 3BL were associated with resistance in adult plants\{0264\}.

QTLs: 'ITMI population': In addition to tsc2 which accounted for 69% of the phenotypic variation in response to race 5, a QTL in chromosome 4AL (Xksu916(Oxo)-4AS, W-7948) accounted for 20% of the phenotypic variation {10015}.

Salamouni/Katepwa: RIL population: variation at the Tsc2 locus explained 54% of the variation in response to race DW5 {10871}.

102.3. Resistance to tan spot

**Tsr1.** \[tsn1 See: Insensitivity to tanspot toxin]. Resistance is recessive.  5BL.  v: Genetic stocks that do not have Tsn1 and other genes that respond to toxins produced by the pathogen. The gene in Erik was allelic with resistance in a diverse set of genotypes including spelt and durum derivatives {10557}.

**Tsr2.** Resistance is recessive. Confers resistance to race 3 \{10344\}. \[tsn2\{10344\}\]. 3BL\{10344\}.  surt: LDN (DIC-3B)\{10344\}.  tv: T. dicoccoides Israel-A\{10344\}.  tv2: T. turgidum no. 283, PI 352519 Tsr5\{10344\}.  ma: Identified as a QTL in region Xgwm285-3B - Xwmc366.2-3B (R^2 = 91%)\{10344\}; also classified as a single gene: Xgwm285-3B - 2.1 cM - tsn2 - 15.2 cM - Xwmc366.2-3B\{10344\}.

**Tsr3.** \[tsn3\{10394\}\]. 3D\{10394\}.3DS\{10419\}.  v: XX41 = [Langdon/Ae. tauschii CI 00017]{10394}; XX45{10394}; XX110{10394}.  dv: Ae. tauschii CI 00017\{10394\}.  ma: Xgwm2a - tsn3, 15.3 cM, 14.4 cM and 9.5 cM in CS/XX41, CS/XX45 and CS/XX110, respectively\{10419\}. Resistances in XX41 and XX110 were recessive whereas that in XX45 was dominant - all three were hemizygous-effective \{10394\}. The genes were given different temporary designations \{10394, 10419\}, but all will be considered to have a common gene until they are shown to be different.

**Tsr4.** Resistance is recessive. Resistance to race 1 (culture ASC1a) \{10350\}. \[tsn4\{10350\}\]. 3A\{10350\}.  v: Salamouni\{10350\}.

**Tsr5.** \[tsn\{10509\}\]. 3BL\{10509\}.  tv2: T. turgidum no. 283, PI 352519 Tsr2\{10509\}.  ma: Tsr5 - 8.3 cM - Xgwm285-3B - 2.7 cM - Tsr2\{10509\}.

**Tsr6\{10668\}.** Resistance is recessive. 2BS\{10668\}.  v: ND-735\{10668\}.  ma: Xwmc382-2B - 15.3 cM - wPt-0289 - 4.6 cM - Tsr6 - 18.7 cM - Xwmc-2B\{10668\}. According to \{10668\} Tsr6 should be identical to tsc2 (see Insensitivity to tan spot toxin (chlorosis)).

**TsrAri\{10765\}.** Recessive 3A\{10765\}.  v: Arina\{10765\}; Heines VII\{10765\}; Zenith\{10765\}.

**TsrHar\{10590\}.** 3B\{10590\}.  v: Dashen\{10590\}; HAR 604\{10590\}; HAR 2562\{10590\}. Effective against races ASC1a (race 1) and DW-16 \{10590\}.

Grandin(S)/BR34(R) RILs: QTL in 1BS, QTs.fcu-1BS, (13-29% of variation depending on race) and 3BL, (13-41%) were involved in resistance to 4 races. Five other QTL showed race specific responses \{10248\}. 

Introgressions of genes for insensitivity to Ptr ToxA and Ptr ToxB are outlined in {10153}.

TA4152-60(R)/ND495(S) DH population. Five QTLs for resistance, all from TA4152-60 {10580}, viz., QTs.fcu-2AS and QTs.fcu-5BL.1 conferring resistance to all races used, QTs.fcu-5AL conferring resistance to races 1, 2 and 5, QTs.fcu-5B.2 conferring resistance to races 1 and 2, and QTs.fcu-4AL conferring resistance to race 3.

WH542(R)/HD29(S) RIL population: SIM indicated QTL on chromosomes 1B, 3AS, 3BL, 5B and 6BS, but only two were confirmed by CIM, Qts.ksu-3AS flanked by Xbarc45-3A and Xbarc86-3A (LOD 5.4, R² = 0.23) and Qts.ksu-5BL (probably Tsn1) flanked by Xgwm499-5B and Xest.stsbe968-5B (LOD 6.5, R² = 0.27) {10552}.

Batavia (S) / Ernie (R): DH population tested over three years. Four (1A(Ernie), 7A, 2BS, 3BS(Batavia)), five (2BS, 5BL(E), 3D, 6A, 7D(B)) and four (2BS, 5BL(E), 1A, 6A(B),) QTL accounted for most of the variation in each year. The greatest effect across years was the QTL on chromosome 2BS (R²=0.382, 0.298 and 0.362, respectively). This QTL was validated in four additional populations {10782}.

Wangshuibai / Ning 7840: RIL population: Race 1: QTS.ksu-1AS, R²=0.39 (nearest marker Xcfa2153-1A and QTS.ksu-2BS, R²=0.04) (nearest marker Xbarc2-2B) {10753}.

103. Reaction to *Rhizoctonia* spp.
    Cause of Rhizoctonia root rot.
    **Rot1** {10761}.  *v*: Scarlet-Rz1 {10761}.
    Scarlet-Rz1 was produced by mutagenesis {10761}.

104. Reaction to *Sitobion avenae*
    English grain aphid.
    **Sa1** {10877}.  *[RA-1*{10877}].  6AL{10877}.  **tv**: C273{10877}.  **ma**: Xwmc179-6A - 3.37 cM - Sa1 - 4.73 cM - Xwmc580-6A {10877}.

105. Reaction to *Sitodiplosis mosellana* (Gehin)
    Insect pest: Orange blossom wheat midge, Wheat midge. This pest should not be confused with *Contarinia tritici*, the yellow blossom wheat midge.
    **Sm1** {0218}.  2B{0218}.  **v**: Augusta {0218}; Blueboy {0218}; Caldwell {0218}; Clark {0218}; FL302 {0218}; Howell {0218}; Knox 62 {0218}; Mono {0218}; Seneca {0218}.  **ma**: Linked to a SCAR marker {0223}.  Sm1 was mapped to a 2.5 cM interval on chromosome 2BS flanked proximally by AFLP-derived SCAR marker WMI and distally by SSR Xgwm210-2B {10291}.

QTL:

Reeder I/Conan: RIL population: QSm.mst-1A, flanked by Xwmc59-1A and Xbarc1022-1A was the most effective and constant QTL for reduced larval infection over two years (R²=0.17 and 0.34) {10841}. RILs with this QTL in three genetic backgrounds had reduced infestations of 42% {10841}.

106. Reaction to *Schizaphis graminum* Rond. (*Toxoptera graminum* Rond.)
    Insect pest: Greenbug
**193  PATHOGENIC DISEASE/PEST REACTION**

Resistance to race 19 was associated with chromosome 6A of Cadet, Kota, Thatcher and TD18 \{0208 \}. In the case of Cadet, resistance was localized to 6AS \{0208 \}.

112. Reaction to Wheat Spindle Streak Mosaic Bymovirus (WSSMV)

QTL : 79% of the variation between Geneva (resistant) and Augusta (susceptible) was associated with markers \( Xbcd1095-2D \) and \( Xcdo373-2D \) located 12.4 cM apart in chromosome 2DL \{0131 \}. WSSMV is soil-borne and vectored by the fungus Polymxa graminis. This virus has some sequences similarity to Wheat Yellow Mosaic \{10285 \}.

\( Wss1 \{10271 \} \).  Derived from \( Haynaldia villosa \) 4D(4DL.4VS)\{10271 \}.T4VS.4DL\{10271 \}.

\( tr \): NAU413\{10271 \} .  \( su \): Yangmai#5 4V(4D)\{10271 \}.

113. Reaction to Wheat Streak Mosaic Virus

Vectored by wheat curl mites, \( Eriophyes tulipae \) and \( E. tosichella \). See: Resistance to colonization by \( Eriophyes tulipae \). According to \{10226 \} WSMV may also be see-borne. At least some sources of resistance to WSMV are also effective against Triticum mosaic virus.

\( Wsm1 \{379,440 \} \).  Derived from \( Th. intermedium \). \( i \): Karl*4/CI 17884 = PI 583794 = KS93WGRC27\{440 \} .  \( v \): CI 17766 = B-6-37-1\{391,800,1543 \}; CI 17884\{391 \}; KS90H445\{391 \}; KS90H450\{391 \}; CI 17883\{391 \}.  \( ad \): CI 17881; CI 17886\{391 \}.  \( su \): 4J\{4A\}:CI 15092\{391 \}; 4J\{4D\}:CI 17882 and CI 17885\{391 \}.  \( ma \): \( Wsm1 \) co-segregated with a STS amplified by the primer set STS\{1456 \}. 4D = T4DL.4J\{391,389 \}.  \( v \): KS08WGGRC50\{10788 \}. 4A \{800 \} = T4AL.4J\{391 \}. \( 6A \): T6AL.4J\{391 \}. \( Wsm1 \) is located in 4J\{391 \}.

\( Wsm1 \) is also confers resistance to Triticum Mosaic Virus \{10788 \}.

\( Wsm2 \{10802,10898 \} \).  3BS\{10802 \}.  \( v \): CO960293-2\{10802 \}; RonL\{10898 \}; Snowmass\{10802 \}.  \( ma \): \( Wsm2 \) - 5.2 cM - \( XSTS3B-55 \{10802 \}; \( Xbarc102-3B \) - 1.6 cM - \( Wsm2 \{10802 \}; \( Xgwm389-3B \) - 30.8 cM - \( Wsm2 \) - 45.2 cM - \( Xgwm566-3B \{10898 \}. \( Wsm2 \) also confers resistance at temperatures below 19C \{10802 \}.

\( Wsm3 \{10775 \} \).  7B(7BS.7S\#3L)\{10775 \}.  \( v \): TA5624\{10775 \}.

114. Reaction to \( Xanthomonas campestris \) pv. \( undulosa \)

Disease: Bacterial leaf streak

\( Bls1 \{244 \} \).  \( v \): Pavon \( Bls2 \{244 \}; Mochis T88 \( Bls3 \) \( Bls4 \{244 \}; \) Angostura F88 \( Bls5 \{244 \}.

\( Bls2 \{244 \} \).  \( v \): Pavon \( Bls1 \{244 \}.

\( Bls3 \{244 \} \).  \( v \): Mochis T88 \( Bls1 \) \( Bls4 \{244 \}.

\( Bls4 \{244 \} \).  \( v \): Mochis T88 \( Bls1 \) \( Bls3 \{244 \}.

\( Bls5 \{244 \} \).  \( v \): Turnco F88\{244 \}; Angostura F88 \( Bls1 \{244 \}.

\( bls1 \) \( bls2 \) \( bls3 \) \( bls4 \) \( bls5 \): Alondra \{244 \}.
115. Resistance to Colonization by *Eriophyes tulipae* (*Aceria tulipae*)

Mite pest: Wheat curl mite.  
*Eriophyes tulipae* is the vector of wheat streak mosaic virus (WSMV) and the wheat spot mosaic agent (WSpM).

**Cmc1**{1467}.  6DS{1576}.  i: Norsa*5/Cmc1{10166}.  v: *Ae. squarrosa*  
CI4/Novamichurinka (= AC PGR 16635){1467}; Norstar derivative{0222}.

**Cmc2**{1573}.  Derived from *Th. elongatum*.  6A = T6AS.6Ae#2S{389}.5B = T5BL.6Ae#2S{389}.6D{1575} = T6DL.6Ae#2S{1575,389}.  i: Norstar*5/Cmc2{10166}.  v: 875-94-2{389}.  tr: Rescue Derivative{1575}.  su: Cadet 6Ae#2(6A){1575}; Cadet 6Ae#2(6D){1574}; Rescue 6Ae#2(6A){1574}; Rescue 6Ae#2(6B){1574}; Rescue 6Ae#2(6D).  ad: Cadet + mono-6Ae#2{1574}.

**Cmc3**{0222}.  1A = 1AL.1RS.  i: Norstar*5/Cmc3 {10166}.  Need to confirm relationship of 1RS segment in Amigo and Salmon as this NIL was derived from KS80H4200 a Chinese Spring Salmon line{10166}.  v:  Amigo; TAM107{0222}.  v2: KS96GRC40 *Cmc4*{0222}.  ma: Wheat lines with the 1RS segment and hence *Cmc3* can be selected with the rye-specific SSR *Xscm09-1R*{0222}.

116. Reaction to Wheat Yellow Mosaic Virus

WYMV is soil-borne and vectored by the fungus *Polymxa graminis*. This virus has some sequence similarity to Wheat Spindle Streak Mosaic {10258}.  
Vectored by *Polymxa graminis*. MYMV is closely related to WSSMV, another bymovirus.

**YmLb**{10750}.  2DL{10750}.  v: Ibis{10750}; Jagger{10750}; KS 831957{10750}; Madsen{10750}; Yumechikara{10750}.  ma: *Xwmc181-2D* - 12.4 cM - *Ymlb* - 2.0 cM - *Xcfid16-2D* - 2.0 cM - *Xwmc41-2D* - 3.1 cM - *Xcfid68-2D*{10750}.

The relationship of *Ymlb* to previously mapped gene in 2DL for resistance to WYMC and WSSMV in Yangfu 9311 {10258} and a Geneva derivative {0131} were not established.

**YmYF**{10258}.  2DL{10258}.  v: Yangfu 931{10258}.  ma: *Xpsp3039-2D/Xwmc181-2D* - 0.7 cM - *Xwmc41-3D* - 8.1 cM - *Xgwm349-2D*{10258}.
